GAM NAME	PRECUR SEQ-ID	PRECURSOR SEQUENCE	GAM DESCRIPTION
GAM25	6416	GAGGCAGGAG AATTGCTTGA ACCCAGGAAG TGGAGGCTTC AGTGAGCTGA GAACACGCCA CTGCACTCCA GTCCTGGGCA ACAGAGCAAG ACTCTGTCTC	Fig. 8 further provides a conceptual description of a novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 25 (GAM25) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art. GAM25 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM25 was detected is described with additional reference to Figs. 9-15. GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome. GAM25 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM25 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM25 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM25 precursor RNA is designated SEQ ID:6416, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6416 is located from position 52222126 to position 52222224 relative to chromosome X on the `-` strand. GAM25 precursor RNA folds onto itself, forming GAM25 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof. Nucleotide sequence of GAM25 precursor RNA, designated SEQ ID NO: 6416, and a schematic representation of a predicted secondary folding of GAM25 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein. An enzyme complex designated DICER COMPLEX, `dices` the GAM25 folded precursor RNA yielding a GAM25 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM25 RNA, hereby incorporated herein. Expression of GAM25 RNA was experimentally validated in HeLa cells using the methods described with reference to

Figs.22 to 24.

GAM25 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM25 target RNA, herein designated GAM TARGET RNA. GAM25 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM25 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM25 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM25 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM25 RNA, herein designated GAM RNA, to target binding sites on GAM25 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE

I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM25 target RNA into GAM25 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM25 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM25 target genes. The mRNA of each one of this plurality of GAM25 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM25 RNA, herein designated GAM RNA, and which when bound by GAM25 RNA causes inhibition of translation of the GAM25 target mRNA into a corresponding GAM25 target protein.

The mechanism of the translational inhibition exerted by GAM25 RNA, herein designated GAM RNA, on one or more GAM25 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM25 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM25 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM25 RNA, herein designated GAM RNA, of GAM25 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM25 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM25 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM25 RNA correlate with, and may be deduced from, the identity of the GAM25 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM31 6767 GGCTGTGGCT Fig. 8 further provides a conceptual description of another novel bioinformatically

GGATTCAAGT detected oligonucleotides of the present invention, referred to here as Genomic Address

AATCCAGGAT Messenger 31 (GAM31) oligonucleotides modulates expression of respective target genes

AGGCTGTTTC whose function and utility is known in the art.

CATCTGTGAG GAM31 is a novel bioinformatically detectable regulatory, non protein coding,

GCCTATTCTT micro RNA (miRNA)-like oligonucleotide. The method by which GAM31 was detected is

GATTACTTGT described with additional reference to Figs. 9-15.

TTCTGGAGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGCT encoded by the human genome.

GAM31 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM31 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM31

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM31 precursor RNA is designated SEQ ID:6767, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6767 is located from position 57935139 to position 57935222 relative to chromosome 12 on the `-` strand.

GAM31 precursor RNA folds onto itself, forming GAM31 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM31 precursor RNA, designated SEQ ID NO: 6767, and a schematic representation of a predicted secondary folding of GAM31 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM31 folded precursor RNA yielding a GAM31 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM31 RNA, hereby incorporated herein.

GAM31 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM31 target RNA, herein designated GAM TARGET RNA. GAM31 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM31 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM31 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM31 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM31 RNA, herein designated GAM RNA, to target binding sites on GAM31 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE

I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM31 target RNA into GAM31 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM31 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM31 target genes. The mRNA of each one of this plurality of GAM31 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM31 RNA, herein designated GAM RNA, and which when bound by GAM31 RNA causes inhibition of translation of the GAM31 target mRNA into a corresponding GAM31 target protein.

The mechanism of the translational inhibition exerted by GAM31 RNA, herein designated GAM RNA, on one or more GAM31 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM31 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM31 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM31 RNA, herein designated GAM RNA, of GAM31 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM31 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM31 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM31 RNA correlate with, and may be deduced from, the identity of the GAM31 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM44 6280 GAAAAGGTGG Fig. 8 further provides a conceptual description of another novel bioinformatically
TGTCATGTTT detected oligonucleotides of the present invention, referred to here as Genomic Address
TGGGGAGAAT Messenger 44 (GAM44) oligonucleotides modulates expression of respective target genes

CTTACTTCTC whose function and utility is known in the art.

AAATGGAAAT GAM44 is a novel bioinformatically detectable regulatory, non protein coding,
TGCACTTTTT micro RNA (miRNA)-like oligonucleotide. The method by which GAM44 was detected is

described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM44 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM44 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM44

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM44 precursor RNA is designated SEQ ID:6280, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6280 is located from position 48222380 to position 48222439 relative to chromosome 11 on the `+` strand.

GAM44 precursor RNA folds onto itself, forming GAM44 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM44 precursor RNA, designated SEQ ID NO: 6280, and a schematic representation of a predicted secondary folding of GAM44 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated

herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM44 folded precursor RNA yielding a GAM44 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM44 RNA, hereby incorporated herein.

GAM44 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM44 target RNA, herein designated GAM TARGET RNA. GAM44 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM44 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM44 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM44 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM44 RNA, herein designated GAM RNA, to target binding sites on GAM44 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE

I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM44 target RNA into GAM44 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM44 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM44 target genes. The mRNA of each one of this plurality of GAM44 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM44 RNA, herein designated GAM RNA, and which when bound by GAM44 RNA causes inhibition of translation of the GAM44 target mRNA into a corresponding GAM44 target protein.

The mechanism of the translational inhibition exerted by GAM44 RNA, herein designated GAM RNA, on one or more GAM44 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM44 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM44 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM44 RNA, herein designated GAM RNA, of GAM44 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM44 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM44 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM44 RNA correlate with, and may be deduced from, the identity of the GAM44 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM55 5709 ACTGGAAATC Fig. 8 further provides a conceptual description of another novel bioinformatically

A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM106 precursor RNA is designated SEQ ID:7240, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7240 is located from position 13445760 to position 13445858 relative to chromosome 20 on the `-` strand.

GAM106 precursor RNA folds onto itself, forming GAM106 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM106 precursor RNA, designated SEQ ID NO: 7240, and a schematic representation of a predicted secondary folding of GAM106 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM106 folded precursor RNA yielding a GAM106 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM106 RNA, hereby incorporated herein.

GAM106 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM106 target RNA, herein designated GAM TARGET RNA. GAM106 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM106 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM106 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM106 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM106 RNA, herein designated GAM RNA, to target binding sites on GAM106 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM106 target RNA into GAM106 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM106 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM106 target genes. The mRNA of each one of this plurality of GAM106 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM106 RNA, herein designated GAM RNA, and which when bound by GAM106 RNA causes inhibition of translation of the GAM106 target mRNA into a corresponding GAM106 target protein.

The mechanism of the translational inhibition exerted by GAM106 RNA, herein designated GAM RNA, on one or more GAM106 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM106 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM106 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM106 RNA, herein designated GAM RNA, of GAM106 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM106 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM106 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM106 RNA correlate with, and may be deduced from, the identity of the GAM106 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM112 6031 CAGTAAACAT AAGTTCCTCA GGAGAGTTTG ATGTGTGTCA GGTGCTTAGA

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 112 (GAM112) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM112 is a novel bioinformatically detectable regulatory, non protein coding,

ACAGGGCCTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM112 was detected is

ATATATAATC described with additional reference to Figs. 9-15.

AGCCCATGAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGCTATTAC encoded by the human genome.

TG GAM112 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM112 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM112 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM112 precursor RNA is designated SEQ ID:6031, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6031 is located from position 47490562 to position 47490653 relative to chromosome X on the `+` strand.

GAM112 precursor RNA folds onto itself, forming GAM112 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM112 precursor RNA, designated SEQ ID NO: 6031, and a schematic representation of a predicted secondary folding of GAM112 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM112 folded precursor RNA yielding a GAM112 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM112 RNA, hereby incorporated herein.

GAM112 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM112 target RNA, herein designated GAM TARGET RNA. GAM112 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM112 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM112 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM112 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows

three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM112 RNA, herein designated GAM RNA, to target binding sites on GAM112 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE

I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM112 target RNA into GAM112 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM112 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM112 target genes. The mRNA of each one of this plurality of GAM112 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM112 RNA, herein designated GAM RNA, and which when bound by GAM112 RNA causes inhibition of translation of the GAM112 target mRNA into a corresponding GAM112 target protein.

The mechanism of the translational inhibition exerted by GAM112 RNA, herein designated GAM RNA, on one or more GAM112 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM112 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM112 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM112 RNA, herein designated GAM RNA, of GAM112 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM112 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM112 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM112 RNA correlate with, and may be deduced from, the identity of the GAM112 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM144 6899 GTGATCCACA Fig. 8 further provides a conceptual description of another novel bioinformatically

CGCTGGCCCA detected oligonucleotides of the present invention, referred to here as Genomic Address
GGAGTTCGAC Messenger 144 (GAM144) oligonucleotides modulates expression of respective target
genes
ATTTACCGCG whose function and utility is known in the art.

AGGTGGGCGG GAM144 is a novel bioinformatically detectable regulatory, non protein coding,
AGAGCCTGTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM144 was detected is

CCTGTGACGA described with additional reference to Figs. 9-15.

GGGATGAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a
humen gene
encoded by the human genome.

GAM144 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM144

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM144
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM144 precursor RNA is designated SEQ ID:6899, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6899 is located from position 29007729 to position 29007806 relative to chromosome 22 on the `-` strand.

GAM144 precursor RNA folds onto itself, forming GAM144 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM144 precursor RNA, designated SEQ ID NO: 6899, and a schematic representation of a predicted secondary folding of GAM144 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM144 folded precursor RNA yielding a GAM144 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM144 RNA, hereby incorporated herein.

GAM144 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM144 target RNA, herein designated GAM TARGET RNA. GAM144 target
RNA
comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM144 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM144 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM144 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM144 RNA, herein designated GAM RNA, to target binding sites on GAM144 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM144 target RNA into GAM144 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM144 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM144 target genes. The mRNA of each one of this plurality of GAM144 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM144 RNA, herein designated GAM RNA, and which when bound by GAM144 RNA causes inhibition of translation of the GAM144 target mRNA into a corresponding GAM144 target protein.

The mechanism of the translational inhibition exerted by GAM144 RNA, herein designated GAM RNA, on one or more GAM144 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM144 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM144 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM144 RNA, herein designated GAM RNA, of GAM144 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM144 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM144 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM144 RNA

correlate with, and may be deduced from, the identity of the GAM144 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

ACCCTGTGTT whose function and utility is known in the art.

CAAGGTTAGG GAM175 is a novel bioinformatically detectable regulatory, non protein coding,
GGAATTATAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM175 was detected is

TTTCCCAGGT described with additional reference to Figs. 9-15.

CTCCATCGTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GGGGTAATCA encoded by the human genome.

GAGGGGCAGA GAM175 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM175
GAAGGCTTCA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM175
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM175 precursor RNA is designated SEQ ID:7084, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7084 is located from position 94175190 to position 94175299 relative to chromosome X on the `+` strand.

GAM175 precursor RNA folds onto itself, forming GAM175 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM175 precursor RNA, designated SEQ ID NO: 7084, and a schematic representation of a predicted secondary folding of GAM175 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM175 folded precursor RNA yielding a GAM175 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM175 RNA, hereby incorporated herein.

GAM175 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM175 target RNA, herein designated GAM TARGET RNA. GAM175 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM175 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM175 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM175 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM175 RNA, herein designated GAM RNA, to target binding sites on GAM175 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM175 target RNA into GAM175 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM175 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM175 target genes. The mRNA of each one of this plurality of GAM175 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM175 RNA, herein designated GAM RNA, and which when bound by GAM175 RNA causes inhibition of translation of the GAM175 target mRNA into a corresponding GAM175 target protein.

The mechanism of the translational inhibition exerted by GAM175 RNA, herein designated GAM RNA, on one or more GAM175 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM175 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM175 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM175 RNA, herein designated GAM RNA, of GAM175 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM175 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM175 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM175 RNA correlate with, and may be deduced from, the identity of the GAM175 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM189 6298 GAAGTTCCAG Fig. 8 further provides a conceptual description of another novel bioinformatically
GCTGTAGTGC detected oligonucleotides of the present invention, referred to here as Genomic Address
ACTATGATGA Messenger 189 (GAM189) oligonucleotides modulates expression of respective target genes
TCGTACGTAT whose function and utility is known in the art.

GAACAGCCAT GAM189 is a novel bioinformatically detectable regulatory, non protein coding,
TGCACTCCAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM189 was detected is

CCTGGGCAAT described with additional reference to Figs. 9-15.

TC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM189 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM189

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM189
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM189 precursor RNA is designated SEQ ID:6298, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6298 is located from position 95450005 to position 95450076 relative to chromosome 4 on the `+` strand.

GAM189 precursor RNA folds onto itself, forming GAM189 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM189 precursor RNA, designated SEQ ID NO: 6298, and a schematic representation of a predicted secondary folding of GAM189 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM189 folded precursor RNA yielding a GAM189 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM189 RNA, hereby incorporated herein. Expression of GAM189 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM189 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM189 target RNA, herein designated GAM TARGET RNA. GAM189 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM189 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM189 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM189 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM189 RNA, herein designated GAM RNA, to target binding sites on GAM189 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE

I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM189 target RNA into GAM189 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM189 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM189 target genes. The mRNA of each one of this plurality of GAM189 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM189 RNA, herein designated GAM RNA, and which when bound by GAM189 RNA causes inhibition of translation of the GAM189 target mRNA into a corresponding GAM189 target protein.

The mechanism of the translational inhibition exerted by GAM189 RNA, herein designated GAM RNA, on one or more GAM189 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM189 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM189 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM189 RNA, herein designated GAM RNA, of GAM189 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM189 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM189 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM189 RNA correlate with, and may be deduced from, the identity of the GAM189 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM193 6545 GCTGGATATT GCTAAGAATT CAGGTAGTCT CGGGATCTCC AGAGTCTCCA TACTAGGACA GGAGATCTTC AGAACCTGGA GGAATGGAAA TAGTCTAGT

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 193 (GAM193) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM193 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM193 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM193 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM193 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM193 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM193 precursor RNA is designated SEQ ID:6545, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6545 is located from position 150223538 to position 150223636 relative to chromosome 7 on the `-` strand.

GAM193 precursor RNA folds onto itself, forming GAM193 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM193 precursor RNA, designated SEQ ID NO: 6545, and a schematic representation of a predicted secondary folding of GAM193 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM193 folded precursor RNA yielding a GAM193 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM193 RNA, hereby incorporated herein.

GAM193 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM193 target RNA, herein designated GAM TARGET RNA. GAM193 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM193 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM193 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM193 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM193 RNA, herein designated GAM RNA, to target binding sites on GAM193 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM193 target RNA into GAM193 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM193 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM193 target genes. The mRNA of each one of this plurality of GAM193 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM193 RNA, herein designated GAM RNA, and which when bound by GAM193 RNA causes inhibition of translation of the GAM193 target mRNA into a corresponding GAM193 target protein.

The mechanism of the translational inhibition exerted by GAM193 RNA, herein designated GAM RNA, on one or more GAM193 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational

inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM193 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM193 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM193 RNA, herein designated GAM RNA, of GAM193 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM193 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM193 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM193 RNA correlate with, and may be deduced from, the identity of the GAM193 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM205 7010 TCAGGCCTGG Fig. 8 further provides a conceptual description of another novel bioinformatically

AGCCCAGGAA detected oligonucleotides of the present invention, referred to here as Genomic Address

GTCTGGTTTC Messenger 205 (GAM205) oligonucleotides modulates expression of respective target genes

GAATTTCATG whose function and utility is known in the art.

CTTCTAACCT GAM205 is a novel bioinformatically detectable regulatory, non protein coding,

GAGCACTGTA micro RNA (miRNA)-like oligonucleotide. The method by which GAM205 was detected is

CTGCTTGGTG described with additional reference to Figs. 9-15.

GAGTTCTCTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CTAGTCCTAC encoded by the human genome.

CTTTCAGGCA GAM205 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM205

GA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM205

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM205 precursor RNA is designated SEQ ID:7010, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7010 is located from position 34136693 to position 34136794 relative to chromosome 19 on the `+` strand.

GAM205 precursor RNA folds onto itself, forming GAM205 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM205 precursor RNA, designated SEQ ID NO: 7010, and a schematic representation of a predicted secondary folding of GAM205 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM205 folded precursor RNA yielding a GAM205 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM205 RNA, hereby incorporated herein.

GAM205 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM205 target RNA, herein designated GAM TARGET RNA. GAM205 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM205 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM205 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM205 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM205 RNA, herein designated GAM RNA, to target binding sites on GAM205 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM205 target RNA into GAM205 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM205 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM205 target genes. The mRNA of each one of this plurality of GAM205 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM205 RNA, herein

designated GAM RNA, and which when bound by GAM205 RNA causes inhibition of translation of the GAM205 target mRNA into a corresponding GAM205 target protein.

The mechanism of the translational inhibition exerted by GAM205 RNA, herein designated GAM RNA, on one or more GAM205 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM205 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM205 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM205 RNA, herein designated GAM RNA, of GAM205 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM205 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM205 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM205 RNA correlate with, and may be deduced from, the identity of the GAM205 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM206 5681 ACAATAGTCT AAGAGCTAAC TAGTTGCACT TGTCTTTACC CTAGAGGCTT GCTAAATAAA GCATACTTTC TGGAGGGCAA GTGCAGGGGT CGCTTCTGTT TGT

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 206 (GAM206) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM206 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM206 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM206 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM206 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM206

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM206 precursor RNA is designated SEQ ID:5681, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5681 is located from position 63676328 to position 63676430 relative to chromosome 8 on the `+` strand.

GAM206 precursor RNA folds onto itself, forming GAM206 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM206 precursor RNA, designated SEQ ID NO: 5681, and a schematic representation of a predicted secondary folding of GAM206 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM206 folded precursor RNA yielding a GAM206 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM206 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM206 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM206 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM206 target RNA, herein designated GAM TARGET RNA. GAM206 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM206 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM206 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM206 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM206 RNA, herein designated GAM RNA, to target binding sites on GAM206 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM206 target RNA into

GAM206 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM206 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM206 target genes. The mRNA of each one of this plurality of GAM206 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM206 RNA, herein designated GAM RNA, and which when bound by GAM206 RNA causes inhibition of translation of the GAM206 target mRNA into a corresponding GAM206 target protein.

The mechanism of the translational inhibition exerted by GAM206 RNA, herein designated GAM RNA, on one or more GAM206 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM206 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM206 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM206 RNA, herein designated GAM RNA, of GAM206 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM206 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM206 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM206 RNA correlate with, and may be deduced from, the identity of the GAM206 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM240 7259 TGGTTTAGCT Fig. 8 further provides a conceptual description of another novel bioinformatically

TAGGAACAGC detected oligonucleotides of the present invention, referred to here as Genomic Address

ATCTGGCACA Messenger 240 (GAM240) oligonucleotides modulates expression of respective target genes

TAGTAAGTGT whose function and utility is known in the art.

TCAGTGAACG GAM240 is a novel bioinformatically detectable regulatory, non protein coding,

TTAGCTATTA micro RNA (miRNA)-like oligonucleotide. The method by which GAM240 was detected is

CCATCATCAC described with additional reference to Figs. 9-15.

TATTAATGTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGCTAGTGAC encoded by the human genome.

TGTCCTGAGT GAM240 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM240

TACATTA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM240

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM240 precursor RNA is designated SEQ ID:7259, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7259 is located from position 73803662 to position 73803768 relative to chromosome 11 on the `-` strand.

GAM240 precursor RNA folds onto itself, forming GAM240 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM240 precursor RNA, designated SEQ ID NO: 7259, and a schematic representation of a predicted secondary folding of GAM240 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM240 folded precursor RNA yielding a GAM240 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM240 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM240 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM240 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM240 target RNA, herein designated GAM TARGET RNA. GAM240 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM240 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM240 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM240 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region

or in both 3`UTR and 5`UTR regions

The complementary binding of GAM240 RNA, herein designated GAM RNA, to target binding sites on GAM240 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM240 target RNA into GAM240 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM240 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM240 target genes. The mRNA of each one of this plurality of GAM240 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM240 RNA, herein designated GAM RNA, and which when bound by GAM240 RNA causes inhibition of translation of the GAM240 target mRNA into a corresponding GAM240 target protein.

The mechanism of the translational inhibition exerted by GAM240 RNA, herein designated GAM RNA, on one or more GAM240 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM240 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM240 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM240 RNA, herein designated GAM RNA, of GAM240 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM240 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM240 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM240 RNA correlate with, and may be deduced from, the identity of the GAM240 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM270 precursor RNA is designated SEQ ID:5974, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5974 is located from position 46553863 to position 46553949 relative to chromosome 12 on the `+` strand.

GAM270 precursor RNA folds onto itself, forming GAM270 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM270 precursor RNA, designated SEQ ID NO: 5974, and a schematic representation of a predicted secondary folding of GAM270 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM270 folded precursor RNA yielding a GAM270 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM270 RNA, hereby incorporated herein.

GAM270 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM270 target RNA, herein designated GAM TARGET RNA. GAM270 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM270 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM270 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM270 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM270 RNA, herein designated GAM RNA, to target binding sites on GAM270 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM270 target RNA into GAM270 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM270 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM270 target genes. The mRNA of each one of this plurality of GAM270 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM270 RNA, herein designated GAM RNA, and which when bound by GAM270 RNA causes inhibition of translation of the GAM270 target mRNA into a corresponding GAM270 target protein.

The mechanism of the translational inhibition exerted by GAM270 RNA, herein designated GAM RNA, on one or more GAM270 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM270 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM270 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM270 RNA, herein designated GAM RNA, of GAM270 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM270 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM270 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM270 RNA correlate with, and may be deduced from, the identity of the GAM270 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM281 6457 GAGGTGGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically
GATTGCTTGT detected oligonucleotides of the present invention, referred to here as Genomic Address
TCCCCGGAGG Messenger 281 (GAM281) oligonucleotides modulates expression of respective target genes
TTGAAGCTAC whose function and utility is known in the art.

AGTGAGCCTT GAM281 is a novel bioinformatically detectable regulatory, non protein coding,
GATTGTGTCA micro RNA (miRNA)-like oligonucleotide. The method by which GAM281 was detected is

CTGCACTCCA described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAGGTAAGAC encoded by the human genome.

TCTGTCTC GAM281 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM281
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM281
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM281 precursor RNA is designated SEQ ID:6457, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6457 is located from position 51464300 to position 51464397 relative to chromosome 12 on the `-` strand.

GAM281 precursor RNA folds onto itself, forming GAM281 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM281 precursor RNA, designated SEQ ID NO: 6457, and a schematic representation of a predicted secondary folding of GAM281 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM281 folded precursor RNA yielding a GAM281 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM281 RNA, hereby incorporated herein. Expression of GAM281 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM281 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM281 target RNA, herein designated GAM TARGET RNA. GAM281 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM281 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM281 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM281 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM281 RNA, herein designated GAM RNA, to target binding sites on GAM281 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE

I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM281 target RNA into GAM281 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM281 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM281 target genes. The mRNA of each one of this plurality of GAM281 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM281 RNA, herein designated GAM RNA, and which when bound by GAM281 RNA causes inhibition of translation of the GAM281 target mRNA into a corresponding GAM281 target protein.

The mechanism of the translational inhibition exerted by GAM281 RNA, herein designated GAM RNA, on one or more GAM281 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM281 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM281 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM281 RNA, herein designated GAM RNA, of GAM281 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM281 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM281 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM281 RNA correlate with, and may be deduced from, the identity of the GAM281 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 282 (GAM282) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM282 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM282 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM282 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM282 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM282 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM282 precursor RNA is designated SEQ ID:6771, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6771 is located from position 117492532 to position 117492617 relative to chromosome 9 on the `+` strand.

GAM282 precursor RNA folds onto itself, forming GAM282 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM282 precursor RNA, designated SEQ ID NO: 6771, and a schematic representation of a predicted secondary folding of GAM282 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM282 folded precursor RNA yielding a GAM282 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM282 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM282 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM282 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM282 target RNA, herein designated GAM TARGET RNA. GAM282 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM282 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM282 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM282 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM282 RNA, herein designated GAM RNA, to target binding sites on GAM282 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM282 target RNA into GAM282 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM282 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM282 target genes. The mRNA of each one of this plurality of GAM282 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM282 RNA, herein designated GAM RNA, and which when bound by GAM282 RNA causes inhibition of translation of the GAM282 target mRNA into a corresponding GAM282 target protein.

The mechanism of the translational inhibition exerted by GAM282 RNA, herein designated GAM RNA, on one or more GAM282 target genes, herein collectively designated GAM

TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM282 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM282 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM282 RNA, herein designated GAM RNA, of GAM282 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM282 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM282 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM282 RNA correlate with, and may be deduced from, the identity of the GAM282 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM329 RNA, herein designated GAM RNA, to target binding sites on GAM329 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM329 target RNA into GAM329 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM329 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM329 target genes. The mRNA of each one of this plurality of GAM329 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM329 RNA, herein designated GAM RNA, and which when bound by GAM329 RNA causes inhibition of translation of the GAM329 target mRNA into a corresponding GAM329 target protein.

The mechanism of the translational inhibition exerted by GAM329 RNA, herein designated GAM RNA, on one or more GAM329 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM329 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM329 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM329 RNA, herein designated GAM RNA, of GAM329 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM329 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM329 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM329 RNA correlate with, and may be deduced from, the identity of the GAM329 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM330 6328 GAGAATTGCT TGAACCCAGG AGGTGGAGGT TGCAGTGAGC CGAGATCACG

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 330 (GAM330) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM330 is a novel bioinformatically detectable regulatory, non protein coding,

CTACTGCACT micro RNA (miRNA)-like oligonucleotide. The method by which GAM330 was detected is

CCAGCCTGGG described with additional reference to Figs. 9-15.

TGACAGAGTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGACTC encoded by the human genome.

GAM330 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM330

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM330

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM330 precursor RNA is designated SEQ ID:6328, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6328 is located from position 102423230 to position 102423315 relative to chromosome 7 on the `-` strand.

GAM330 precursor RNA folds onto itself, forming GAM330 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM330 precursor RNA, designated SEQ ID NO: 6328, and a schematic representation of a predicted secondary folding of GAM330 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM330 folded precursor RNA yielding a GAM330 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM330 RNA, hereby incorporated herein.

GAM330 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM330 target RNA, herein designated GAM TARGET RNA. GAM330 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM330 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM330 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM330 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows

three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM330 RNA, herein designated GAM RNA, to target binding sites on GAM330 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM330 target RNA into GAM330 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM330 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM330 target genes. The mRNA of each one of this plurality of GAM330 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM330 RNA, herein designated GAM RNA, and which when bound by GAM330 RNA causes inhibition of translation of the GAM330 target mRNA into a corresponding GAM330 target protein.

The mechanism of the translational inhibition exerted by GAM330 RNA, herein designated GAM RNA, on one or more GAM330 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM330 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM330 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM330 RNA, herein designated GAM RNA, of GAM330 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM330 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM330 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM330 RNA correlate with, and may be deduced from, the identity of the GAM330 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM335 5987 CAACCCAGTA Fig. 8 further provides a conceptual description of another novel bioinformatically

AGTGTCCCCA detected oligonucleotides of the present invention, referred to here as Genomic Address GTCAATGCTT Messenger 335 (GAM335) oligonucleotides modulates expression of respective target genes CTCTCCATAG whose function and utility is known in the art.

GAGACCTGTA GAM335 is a novel bioinformatically detectable regulatory, non protein coding, AATGGGCGGT micro RNA (miRNA)-like oligonucleotide. The method by which GAM335 was detected is

GGGGGGAGGA described with additional reference to Figs. 9-15.

ATTTTCTGGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene CTCACACACT encoded by the human genome.

ATTATGGGTT GAM335 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM335 G precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM335

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM335 precursor RNA is designated SEQ ID:5987, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5987 is located from position 22176932 to position 22177032 relative to chromosome 22 on the `+` strand.

GAM335 precursor RNA folds onto itself, forming GAM335 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM335 precursor RNA, designated SEQ ID NO: 5987, and a schematic representation of a predicted secondary folding of GAM335 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM335 folded precursor RNA yielding a GAM335 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM335 RNA, hereby incorporated herein.

GAM335 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM335 target RNA, herein designated GAM TARGET RNA. GAM335 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM335 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM335 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM335 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM335 RNA, herein designated GAM RNA, to target binding sites on GAM335 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM335 target RNA into GAM335 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM335 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM335 target genes. The mRNA of each one of this plurality of GAM335 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM335 RNA, herein designated GAM RNA, and which when bound by GAM335 RNA causes inhibition of translation of the GAM335 target mRNA into a corresponding GAM335 target protein.

The mechanism of the translational inhibition exerted by GAM335 RNA, herein designated GAM RNA, on one or more GAM335 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM335 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM335 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM335 RNA, herein designated GAM RNA, of GAM335 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM335 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM335 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM335 RNA

correlate with, and may be deduced from, the identity of the GAM335 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM347 5807 AGTCTCACTC Fig. 8 further provides a conceptual description of another novel bioinformatically

TGTCTCCTAG detected oligonucleotides of the present invention, referred to here as Genomic Address
GCTGGAGTGC Messenger 347 (GAM347) oligonucleotides modulates expression of respective target
genes
AGTGGCGTGA whose function and utility is known in the art.

TCTCATCTCA GAM347 is a novel bioinformatically detectable regulatory, non protein coding,
TTGCAACCTC micro RNA (miRNA)-like oligonucleotide. The method by which GAM347 was detected is

CACCTCCTGG described with additional reference to Figs. 9-15.

ATTCAAGTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a
humen gene
TTCT encoded by the human genome.

GAM347 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM347

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM347

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM347 precursor RNA is designated SEQ ID:5807, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5807 is located from position 37269373 to position 37269456 relative to chromosome 19 on the `-` strand.

GAM347 precursor RNA folds onto itself, forming GAM347 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM347 precursor RNA, designated SEQ ID NO: 5807, and a schematic representation of a predicted secondary folding of GAM347 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM347 folded precursor RNA yielding a GAM347 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM347 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM347 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM347 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM347 target RNA, herein designated GAM TARGET RNA. GAM347 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM347 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM347 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM347 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM347 RNA, herein designated GAM RNA, to target binding sites on GAM347 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM347 target RNA into GAM347 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM347 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM347 target genes. The mRNA of each one of this plurality of GAM347 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM347 RNA, herein designated GAM RNA, and which when bound by GAM347 RNA causes inhibition of translation of the GAM347 target mRNA into a corresponding GAM347 target protein.

The mechanism of the translational inhibition exerted by GAM347 RNA, herein designated GAM RNA, on one or more GAM347 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM347 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM347 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM347 RNA, herein designated GAM RNA, of GAM347 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM347 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM347 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM347 RNA correlate with, and may be deduced from, the identity of the GAM347 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM354 6728 GGCAGAGCGC Fig. 8 further provides a conceptual description of another novel bioinformatically
TGCCTCTCTG detected oligonucleotides of the present invention, referred to here as Genomic Address
CAGGCCGTGT Messenger 354 (GAM354) oligonucleotides modulates expression of respective target genes
GCTTTGCTCG whose function and utility is known in the art.

GTTGATCTTG GAM354 is a novel bioinformatically detectable regulatory, non protein coding,
CAGAGCCTAA micro RNA (miRNA)-like oligonucleotide. The method by which GAM354 was detected is

GACACAGGCC described with additional reference to Figs. 9-15.

CAGAGAGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GTGATCGCC encoded by the human genome.

GAM354 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM354

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM354

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM354 precursor RNA is designated SEQ ID:6728, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6728 is located from position 50818302 to position 50818390 relative to chromosome 19 on the `+` strand.

GAM354 precursor RNA folds onto itself, forming GAM354 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM354 precursor RNA, designated SEQ ID NO: 6728, and a schematic representation of a predicted secondary folding of GAM354 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM354 folded precursor RNA

yielding a GAM354 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM354 RNA, hereby incorporated herein.

GAM354 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM354 target RNA, herein designated GAM TARGET RNA. GAM354 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM354 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM354 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM354 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM354 RNA, herein designated GAM RNA, to target binding sites on GAM354 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE

I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM354 target RNA into GAM354 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM354 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM354 target genes. The mRNA of each one of this plurality of GAM354 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM354 RNA, herein designated GAM RNA, and which when bound by GAM354 RNA causes inhibition of translation of the GAM354 target mRNA into a corresponding GAM354 target protein.

The mechanism of the translational inhibition exerted by GAM354 RNA, herein designated GAM RNA, on one or more GAM354 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM354 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM354 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM354 RNA, herein designated GAM RNA, of GAM354 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM354 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM354 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM354 RNA correlate with, and may be deduced from, the identity of the GAM354 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM361 7153 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically
GAATCGTTTG detected oligonucleotides of the present invention, referred to here as Genomic Address
AACCTGGGAG Messenger 361 (GAM361) oligonucleotides modulates expression of respective target genes
GCGGAGGTTG whose function and utility is known in the art.

TGTTGAGCCG GAM361 is a novel bioinformatically detectable regulatory, non protein coding,
AGATCTCGCC micro RNA (miRNA)-like oligonucleotide. The method by which GAM361 was detected is

ATTGCACTCC described with additional reference to Figs. 9-15.

AGCCTAGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACAAGAGCGA encoded by the human genome.

AACTCCATCT GAM361 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM361
CA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM361

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM361 precursor RNA is designated SEQ ID:7153, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7153 is located from position 94524959 to position 94525060 relative to chromosome X on the `+` strand.

GAM361 precursor RNA folds onto itself, forming GAM361 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM361 precursor RNA, designated SEQ ID NO: 7153, and a schematic representation of a predicted secondary folding of GAM361 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM361 folded precursor RNA yielding a GAM361 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM361 RNA, hereby incorporated herein.

GAM361 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM361 target RNA, herein designated GAM TARGET RNA. GAM361 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM361 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM361 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM361 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM361 RNA, herein designated GAM RNA, to target binding sites on GAM361 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM361 target RNA into GAM361 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM361 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM361 target genes. The mRNA of each one of this plurality of GAM361 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM361 RNA, herein designated GAM RNA, and which when bound by GAM361 RNA causes inhibition of translation of the GAM361 target mRNA into a corresponding GAM361 target protein.

The mechanism of the translational inhibition exerted by GAM361 RNA, herein designated GAM RNA, on one or more GAM361 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM361 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM361 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM361 RNA, herein designated GAM RNA, of GAM361 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM361 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM361 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM361 RNA correlate with, and may be deduced from, the identity of the GAM361 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM367 7175 TGAGGTAAGT Fig. 8 further provides a conceptual description of another novel bioinformatically
ATGTTATTGG detected oligonucleotides of the present invention, referred to here as Genomic Address
AAAGGTGTGA Messenger 367 (GAM367) oligonucleotides modulates expression of respective target genes
TCTATATAGA whose function and utility is known in the art.

ACCCTGTACA GAM367 is a novel bioinformatically detectable regulatory, non protein coding,
TGAAAAGGAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM367 was detected is

GAGATGCCGC described with additional reference to Figs. 9-15.

TATCTTGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GGGATGATCA encoded by the human genome.

TGTATTTGAA GAM367 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM367
ATAGTAACTC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM367
ACAGCA precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM367 precursor RNA is designated SEQ ID:7175, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7175 is located from position 121833627 to position 121833742 relative to chromosome 10 on the `+` strand.

GAM367 precursor RNA folds onto itself, forming GAM367 folded precursor RNA,

herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM367 precursor RNA, designated SEQ ID NO: 7175, and a schematic representation of a predicted secondary folding of GAM367 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM367 folded precursor RNA yielding a GAM367 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM367 RNA, hereby incorporated herein.

GAM367 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM367 target RNA, herein designated GAM TARGET RNA. GAM367 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM367 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM367 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM367 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM367 RNA, herein designated GAM RNA, to target binding sites on GAM367 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM367 target RNA into GAM367 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM367 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM367 target genes. The mRNA of each one of this plurality of GAM367 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM367 RNA, herein designated GAM RNA, and which when bound by GAM367 RNA causes inhibition of translation of

the GAM367 target mRNA into a corresponding GAM367 target protein.

The mechanism of the translational inhibition exerted by GAM367 RNA, herein designated GAM RNA, on one or more GAM367 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM367 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM367 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM367 RNA, herein designated GAM RNA, of GAM367 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM367 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM367 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM367 RNA correlate with, and may be deduced from, the identity of the GAM367 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM388 5831 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
CAACATGCAG Messenger 388 (GAM388) oligonucleotides modulates expression of respective target genes
GTTTGTTACA whose function and utility is known in the art.

TATGTATACA GAM388 is a novel bioinformatically detectable regulatory, non protein coding,
TGTGCCATGT micro RNA (miRNA)-like oligonucleotide. The method by which GAM388 was detected is

TGGTGTGCTG described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM388 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM388

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM388
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of GAM388 precursor RNA is designated SEQ ID:5831, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5831 is located from position 16098435 to position 16098516 relative to chromosome 1 on the `-` strand.

GAM388 precursor RNA folds onto itself, forming GAM388 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM388 precursor RNA, designated SEQ ID NO: 5831, and a schematic representation of a predicted secondary folding of GAM388 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM388 folded precursor RNA yielding a GAM388 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM388 RNA, hereby incorporated herein.

GAM388 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM388 target RNA, herein designated GAM TARGET RNA. GAM388 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM388 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM388 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM388 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM388 RNA, herein designated GAM RNA, to target binding sites on GAM388 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE

I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM388 target RNA into GAM388 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM388 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM388 target genes. The mRNA of each one of this plurality of GAM388 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM388 RNA, herein designated GAM RNA, and which when bound by GAM388 RNA causes inhibition of translation of the GAM388 target mRNA into a corresponding GAM388 target protein.

The mechanism of the translational inhibition exerted by GAM388 RNA, herein designated GAM RNA, on one or more GAM388 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM388 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM388 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM388 RNA, herein designated GAM RNA, of GAM388 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM388 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM388 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM388 RNA correlate with, and may be deduced from, the identity of the GAM388 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM401 5724 AGAGAGAGTC Fig. 8 further provides a conceptual description of another novel bioinformatically
TCACTCTGTC detected oligonucleotides of the present invention, referred to here as Genomic Address
GCCCAGGCTG Messenger 401 (GAM401) oligonucleotides modulates expression of respective target genes
GAGTGCAGTG whose function and utility is known in the art.

GTGTGATCTC GAM401 is a novel bioinformatically detectable regulatory, non protein coding,
GGCTCACTGC micro RNA (miRNA)-like oligonucleotide. The method by which GAM401 was detected is

AACCTCTGCC described with additional reference to Figs. 9-15.

TTCCGGATTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AAGTGATTCT encoded by the human genome.

CCT GAM401 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM401 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM401 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM401 precursor RNA is designated SEQ ID:5724, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5724 is located from position 14110787 to position 14110879 relative to chromosome 10 on the `+` strand.

GAM401 precursor RNA folds onto itself, forming GAM401 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM401 precursor RNA, designated SEQ ID NO: 5724, and a schematic representation of a predicted secondary folding of GAM401 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM401 folded precursor RNA yielding a GAM401 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM401 RNA, hereby incorporated herein.

GAM401 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM401 target RNA, herein designated GAM TARGET RNA. GAM401 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM401 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM401 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM401 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM401 RNA, herein designated GAM RNA, to target binding sites on GAM401 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM401 target RNA into GAM401 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM401 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM401 target genes. The mRNA of each one of this plurality of GAM401 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM401 RNA, herein designated GAM RNA, and which when bound by GAM401 RNA causes inhibition of translation of the GAM401 target mRNA into a corresponding GAM401 target protein.

The mechanism of the translational inhibition exerted by GAM401 RNA, herein designated GAM RNA, on one or more GAM401 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM401 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM401 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM401 RNA, herein designated GAM RNA, of GAM401 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM401 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM401 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM401 RNA correlate with, and may be deduced from, the identity of the GAM401 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM408 6597 GGACTGAAAG AGAACTGGGA TGGAGGAGAA TTAGAGGATG GTGTGGTGTT TCCCAAGACA

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 408 (GAM408) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM408 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM408 was detected is

TCCCCTGATC described with additional reference to Figs. 9-15.

TTGCTATCCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGCATCTCCT encoded by the human genome.

AGACC GAM408 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM408 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM408 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM408 precursor RNA is designated SEQ ID:6597, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6597 is located from position 62113790 to position 62113884 relative to chromosome 14 on the `-` strand.

GAM408 precursor RNA folds onto itself, forming GAM408 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM408 precursor RNA, designated SEQ ID NO: 6597, and a schematic representation of a predicted secondary folding of GAM408 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM408 folded precursor RNA yielding a GAM408 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM408 RNA, hereby incorporated herein.

GAM408 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM408 target RNA, herein designated GAM TARGET RNA. GAM408 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM408 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM408 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM408 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM408 RNA, herein designated GAM RNA, to target binding sites on GAM408 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM408 target RNA into GAM408 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM408 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM408 target genes. The mRNA of each one of this plurality of GAM408 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM408 RNA, herein designated GAM RNA, and which when bound by GAM408 RNA causes inhibition of translation of the GAM408 target mRNA into a corresponding GAM408 target protein.

The mechanism of the translational inhibition exerted by GAM408 RNA, herein designated GAM RNA, on one or more GAM408 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM408 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM408 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM408 RNA, herein designated GAM RNA, of GAM408 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM408 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM408 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM408 RNA correlate with, and may be deduced from, the identity of the GAM408 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM426 6113 CCTCCTGCTG AAGCTTCTGG ATTTGAGAGG

GTATGTGGGC detected oligonucleotides of the present invention, referred to here as Genomic Address
CATTTTCTGC Messenger 492 (GAM492) oligonucleotides modulates expression of respective target
genes
CCGTAAAATG whose function and utility is known in the art.

TTCAAATGTT GAM492 is a novel bioinformatically detectable regulatory, non protein coding,
TTCTCTCTCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM492 was detected is

AAAGCTTTGT described with additional reference to Figs. 9-15.

TCATTGTATC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a
humen gene
TGGTGGAATT encoded by the human genome.

TTGGTTCTCA GAM492 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GAM492
GGGAGTAGAC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA
genes GAM492

A precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM492 precursor RNA is designated SEQ ID:7264, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7264 is located from position 43642880 to position 43642990 relative to chromosome 17 on the `-` strand.

GAM492 precursor RNA folds onto itself, forming GAM492 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM492 precursor RNA, designated SEQ ID NO: 7264, and a schematic representation of a predicted secondary folding of GAM492 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM492 folded precursor RNA yielding a GAM492 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM492 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM492 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM492 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM492 target RNA, herein designated GAM TARGET RNA. GAM492 target
RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM492 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM492 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM492 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM492 RNA, herein designated GAM RNA, to target binding sites on GAM492 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM492 target RNA into GAM492 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM492 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM492 target genes. The mRNA of each one of this plurality of GAM492 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM492 RNA, herein designated GAM RNA, and which when bound by GAM492 RNA causes inhibition of translation of the GAM492 target mRNA into a corresponding GAM492 target protein.

The mechanism of the translational inhibition exerted by GAM492 RNA, herein designated GAM RNA, on one or more GAM492 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM492 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM492 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM492 RNA, herein designated GAM RNA, of GAM492 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM492 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM492 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7,

incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM492 RNA correlate with, and may be deduced from, the identity of the GAM492 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM495 6079 CCCGACCACT Fig. 8 further provides a conceptual description of another novel bioinformatically
AGCAGCCTCT detected oligonucleotides of the present invention, referred to here as Genomic Address
TTCAGTCACT Messenger 495 (GAM495) oligonucleotides modulates expression of respective target genes
GGAAAATGCT whose function and utility is known in the art.

TACAGGCAGT GAM495 is a novel bioinformatically detectable regulatory, non protein coding,
AGCCACCATC micro RNA (miRNA)-like oligonucleotide. The method by which GAM495 was detected is

ATGTGGCACA described with additional reference to Figs. 9-15.

AAGTGGGCAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CATCCTAGTG encoded by the human genome.

TCTAACATTT GAM495 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM495
AAGCTGTGGT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM495
TCTGG precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM495 precursor RNA is designated SEQ ID:6079, and is provided hereinbelow with reference to the sequence listing part.

GAM495 precursor RNA folds onto itself, forming GAM495 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM495 precursor RNA, designated SEQ ID NO: 6079, and a schematic representation of a predicted secondary folding of GAM495 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM495 folded precursor RNA yielding a GAM495 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM495 RNA, hereby incorporated herein. Expression of GAM495 RNA

was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM495 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM495 target RNA, herein designated GAM TARGET RNA. GAM495 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM495 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM495 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM495 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM495 RNA, herein designated GAM RNA, to target binding sites on GAM495 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM495 target RNA into GAM495 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM495 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM495 target genes. The mRNA of each one of this plurality of GAM495 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM495 RNA, herein designated GAM RNA, and which when bound by GAM495 RNA causes inhibition of translation of the GAM495 target mRNA into a corresponding GAM495 target protein.

The mechanism of the translational inhibition exerted by GAM495 RNA, herein designated GAM RNA, on one or more GAM495 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM495 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM495 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM495 RNA, herein designated GAM RNA, of GAM495 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM495 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM495 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM495 RNA correlate with, and may be deduced from, the identity of the GAM495 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM507 6783 GGGAGACCCA Fig. 8 further provides a conceptual description of another novel bioinformatically
GGACCCGGGA detected oligonucleotides of the present invention, referred to here as Genomic Address
GAGAGGTAGA Messenger 507 (GAM507) oligonucleotides modulates expression of respective target genes
GGGGAGCAGA whose function and utility is known in the art.

GACAGCCACC GAM507 is a novel bioinformatically detectable regulatory, non protein coding,
AGCTTCTATC micro RNA (miRNA)-like oligonucleotide. The method by which GAM507 was detected is

TTCTGCTCTA described with additional reference to Figs. 9-15.

AGCACATTCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTCACGAGTT encoded by the human genome.

TAAGTTTCCT GAM507 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM507
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM507
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM507 precursor RNA is designated SEQ ID:6783, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6783 is located from position 40608766 to position 40608865 relative to chromosome 15 on the `+` strand.

GAM507 precursor RNA folds onto itself, forming GAM507 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM507 precursor RNA, designated SEQ ID NO: 6783, and a schematic representation of a predicted secondary folding of GAM507 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM507 folded precursor RNA yielding a GAM507 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM507 RNA, hereby incorporated herein.

GAM507 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM507 target RNA, herein designated GAM TARGET RNA. GAM507 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM507 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM507 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM507 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM507 RNA, herein designated GAM RNA, to target binding sites on GAM507 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM507 target RNA into GAM507 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM507 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM507 target genes. The mRNA of each one of this plurality of GAM507 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM507 RNA, herein designated GAM RNA, and which when bound by GAM507 RNA causes inhibition of translation of the GAM507 target mRNA into a corresponding GAM507 target protein.

The mechanism of the translational inhibition exerted by GAM507 RNA, herein designated GAM RNA, on one or more GAM507 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM507 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM507 folded precursor RNA, herein

designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM507 RNA, herein designated GAM RNA, of GAM507 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM507 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM507 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM507 RNA correlate with, and may be deduced from, the identity of the GAM507 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM519 5696 ACCTATTCCC TGTGGCTTAG GTGAGCATGT GACCAGGCCT GGCCTCCTGA GTCCCACAGC TTCCTAGCCA CAGTGATAAA AGAATGGGT

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 519 (GAM519) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM519 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM519 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM519 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM519 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM519 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM519 precursor RNA is designated SEQ ID:5696, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5696 is located from position 32800605 to position 32800693 relative to chromosome 18 on the `-` strand.

GAM519 precursor RNA folds onto itself, forming GAM519 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of

the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM519 precursor RNA, designated SEQ ID NO: 5696, and a schematic representation of a predicted secondary folding of GAM519 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM519 folded precursor RNA yielding a GAM519 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM519 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM519 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM519 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM519 target RNA, herein designated GAM TARGET RNA. GAM519 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM519 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM519 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM519 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM519 RNA, herein designated GAM RNA, to target binding sites on GAM519 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM519 target RNA into GAM519 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM519 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM519 target genes. The mRNA of each one of this plurality of GAM519 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM519 RNA, herein designated GAM RNA, and which when bound by GAM519 RNA causes inhibition of translation of the GAM519 target mRNA into a corresponding GAM519 target protein.

The mechanism of the translational inhibition exerted by GAM519 RNA, herein

designated GAM RNA, on one or more GAM519 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM519 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM519 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM519 RNA, herein designated GAM RNA, of GAM519 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM519 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM519 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM519 RNA correlate with, and may be deduced from, the identity of the GAM519 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TCAGGGATTT detected oligonucleotides of the present invention, referred to here as Genomic Address
TCTGGTTTGA Messenger 520 (GAM520) oligonucleotides modulates expression of respective target genes
GAGACAATGA whose function and utility is known in the art.

CACACACCCC GAM520 is a novel bioinformatically detectable regulatory, non protein coding,
TAAGTTCACC micro RNA (miRNA)-like oligonucleotide. The method by which GAM520 was detected is

TTCTCTCGAA described with additional reference to Figs. 9-15.

TAGTAGGCCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGCTCTTAC encoded by the human genome.

GAM520 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM520

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM520

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM520 precursor RNA is designated SEQ ID:6864, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6864 is located from position 43020516 to position 43020604 relative to chromosome 17

on the `+` strand.

GAM520 precursor RNA folds onto itself, forming GAM520 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM520 precursor RNA, designated SEQ ID NO: 6864, and a schematic representation of a predicted secondary folding of GAM520 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM520 folded precursor RNA yielding a GAM520 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM520 RNA, hereby incorporated herein.

GAM520 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM520 target RNA, herein designated GAM TARGET RNA. GAM520 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM520 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM520 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM520 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM520 RNA, herein designated GAM RNA, to target binding sites on GAM520 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE

I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM520 target RNA into GAM520 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM520 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM520 target genes. The mRNA of each one of this plurality

of GAM520 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM520 RNA, herein designated GAM RNA, and which when bound by GAM520 RNA causes inhibition of translation of the GAM520 target mRNA into a corresponding GAM520 target protein.

The mechanism of the translational inhibition exerted by GAM520 RNA, herein designated GAM RNA, on one or more GAM520 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM520 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM520 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM520 RNA, herein designated GAM RNA, of GAM520 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM520 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM520 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM520 RNA correlate with, and may be deduced from, the identity of the GAM520 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GATC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM569

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM569 precursor RNA is designated SEQ ID:6459, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6459 is located from position 50818294 to position 50818397 relative to chromosome 19 on the `+` strand.

GAM569 precursor RNA folds onto itself, forming GAM569 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM569 precursor RNA, designated SEQ ID NO: 6459, and a schematic representation of a predicted secondary folding of GAM569 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM569 folded precursor RNA yielding a GAM569 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM569 RNA, hereby incorporated herein.

GAM569 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM569 target RNA, herein designated GAM TARGET RNA. GAM569 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM569 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM569 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM569 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in

the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM569 RNA, herein designated GAM RNA, to target binding sites on GAM569 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM569 target RNA into GAM569 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM569 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM569 target genes. The mRNA of each one of this plurality of GAM569 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM569 RNA, herein designated GAM RNA, and which when bound by GAM569 RNA causes inhibition of translation of the GAM569 target mRNA into a corresponding GAM569 target protein.

The mechanism of the translational inhibition exerted by GAM569 RNA, herein designated GAM RNA, on one or more GAM569 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM569 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM569 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM569 RNA, herein designated GAM RNA, of GAM569 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM569 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM569 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM569 RNA correlate with, and may be deduced from, the identity of the GAM569 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM572 5713 AGAACAAGGG CTAAATTCAA ATCAAATTTT CCCTGTACCC Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 572 (GAM572) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

TAAGAAAAAT GAM572 is a novel bioinformatically detectable regulatory, non protein coding, AATTAGGCCG micro RNA (miRNA)-like oligonucleotide. The method by which GAM572 was detected is

GGAGATGTTT described with additional reference to Figs. 9-15.

GACTAAGTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GTAGGCATTG encoded by the human genome.

TTCT GAM572 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM572

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM572

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM572 precursor RNA is designated SEQ ID:5713, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5713 is located from position 14718325 to position 14718418 relative to chromosome 10 on the `-` strand.

GAM572 precursor RNA folds onto itself, forming GAM572 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM572 precursor RNA, designated SEQ ID NO: 5713, and a schematic representation of a predicted secondary folding of GAM572 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM572 folded precursor RNA yielding a GAM572 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM572 RNA, hereby incorporated herein.

GAM572 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM572 target RNA, herein designated GAM TARGET RNA. GAM572 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM572 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM572 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the

nucleotide sequence of GAM572 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM572 RNA, herein designated GAM RNA, to target binding sites on GAM572 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM572 target RNA into GAM572 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM572 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM572 target genes. The mRNA of each one of this plurality of GAM572 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM572 RNA, herein designated GAM RNA, and which when bound by GAM572 RNA causes inhibition of translation of the GAM572 target mRNA into a corresponding GAM572 target protein.

The mechanism of the translational inhibition exerted by GAM572 RNA, herein designated GAM RNA, on one or more GAM572 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM572 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM572 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM572 RNA, herein designated GAM RNA, of GAM572 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM572 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM572 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM572 RNA correlate with, and may be deduced from, the identity of the GAM572 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM584 6201 CTGAGGCACC Fig. 8 further provides a conceptual description of another novel bioinformatically
TCCACTGGCC detected oligonucleotides of the present invention, referred to here as Genomic Address
CCTTTGTGAG Messenger 584 (GAM584) oligonucleotides modulates expression of respective target genes
GCACGCTTGA whose function and utility is known in the art.

CCTGGGTTTC GAM584 is a novel bioinformatically detectable regulatory, non protein coding,
ATGGAAAGAA micro RNA (miRNA)-like oligonucleotide. The method by which GAM584 was detected is

TGTGCCCTCA described with additional reference to Figs. 9-15.

CCAAAGGGTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CTAAACAAGG encoded by the human genome.

CCCCAG GAM584 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM584
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM584
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM584 precursor RNA is designated SEQ ID:6201, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6201 is located from position 67800165 to position 67800260 relative to chromosome 11 on the `+` strand.

GAM584 precursor RNA folds onto itself, forming GAM584 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM584 precursor RNA, designated SEQ ID NO: 6201, and a schematic representation of a predicted secondary folding of GAM584 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM584 folded precursor RNA yielding a GAM584 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM584 RNA, hereby incorporated herein.

GAM584 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM584 target RNA, herein designated GAM TARGET RNA. GAM584 target RNA
comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated

region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM584 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM584 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM584 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM584 RNA, herein designated GAM RNA, to target binding sites on GAM584 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM584 target RNA into GAM584 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM584 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM584 target genes. The mRNA of each one of this plurality of GAM584 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM584 RNA, herein designated GAM RNA, and which when bound by GAM584 RNA causes inhibition of translation of the GAM584 target mRNA into a corresponding GAM584 target protein.

The mechanism of the translational inhibition exerted by GAM584 RNA, herein designated GAM RNA, on one or more GAM584 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM584 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM584 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM584 RNA, herein designated GAM RNA, of GAM584 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM584 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM584 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM584 RNA correlate with, and may be deduced from, the identity of the GAM584 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM593 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM593 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM593 RNA correlate with, and may be deduced from, the identity of the GAM593 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM604 6153 CTAGCTGCTG CCAGCCAAGC TGCTACCAGA CCAGCTCCTG CGGAACTGGC TGTGGCATTG GTGGTGGCAT TGG

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 604 (GAM604) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM604 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM604 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM604 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM604 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM604 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM604 precursor RNA is designated SEQ ID:6153, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6153 is located from position 39106109 to position 39106181 relative to chromosome 17 on the `-` strand.

GAM604 precursor RNA folds onto itself, forming GAM604 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of

the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM604 precursor RNA, designated SEQ ID NO: 6153, and a schematic representation of a predicted secondary folding of GAM604 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM604 folded precursor RNA yielding a GAM604 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM604 RNA, hereby incorporated herein.

GAM604 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM604 target RNA, herein designated GAM TARGET RNA. GAM604 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM604 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM604 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM604 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM604 RNA, herein designated GAM RNA, to target binding sites on GAM604 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM604 target RNA into GAM604 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM604 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM604 target genes. The mRNA of each one of this plurality of GAM604 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM604 RNA, herein designated GAM RNA, and which when bound by GAM604 RNA causes inhibition of translation of the GAM604 target mRNA into a corresponding GAM604 target protein.

The mechanism of the translational inhibition exerted by GAM604 RNA, herein designated GAM RNA, on one or more GAM604 target genes, herein collectively designated GAM

TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM604 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM604 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM604 RNA, herein designated GAM RNA, of GAM604 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM604 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM604 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM604 RNA correlate with, and may be deduced from, the identity of the GAM604 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM640 6536 GCTCGTTGCC Fig. 8 further provides a conceptual description of another novel bioinformatically
CAGGCTGGAG detected oligonucleotides of the present invention, referred to here as Genomic Address
TGCAATGGCG Messenger 640 (GAM640) oligonucleotides modulates expression of respective target genes
TGATCTTGGC whose function and utility is known in the art.

TCACCACAAC GAM640 is a novel bioinformatically detectable regulatory, non protein coding,
CTCCACTTCC micro RNA (miRNA)-like oligonucleotide. The method by which GAM640 was detected is

CAGGTTCAAG described with additional reference to Figs. 9-15.

CGATTCTCAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GCCTTAGCCT encoded by the human genome.

CCCAAGTAGC GAM640 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM640
TGGGATTACA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM640
GGC precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM640 precursor RNA is designated SEQ ID:6536, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6536 is located from position 74052253 to position 74052365 relative to chromosome 2 on the `-` strand.

GAM640 precursor RNA folds onto itself, forming GAM640 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM640 precursor RNA, designated SEQ ID NO: 6536, and a schematic representation of a predicted secondary folding of GAM640 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM640 folded precursor RNA yielding a GAM640 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM640 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM640 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM640 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM640 target RNA, herein designated GAM TARGET RNA. GAM640 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM640 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM640 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM640 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM640 RNA, herein designated GAM RNA, to target binding sites on GAM640 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM640 target RNA into GAM640 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM640 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM640 target genes. The mRNA of each one of this plurality

of GAM640 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM640 RNA, herein designated GAM RNA, and which when bound by GAM640 RNA causes inhibition of translation of the GAM640 target mRNA into a corresponding GAM640 target protein.

The mechanism of the translational inhibition exerted by GAM640 RNA, herein designated GAM RNA, on one or more GAM640 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM640 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM640 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM640 RNA, herein designated GAM RNA, of GAM640 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM640 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM640 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM640 RNA correlate with, and may be deduced from, the identity of the GAM640 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM667 6906 GTGCCTCATC Fig. 8 further provides a conceptual description of another novel bioinformatically
TGTAGGTGGT detected oligonucleotides of the present invention, referred to here as Genomic Address
TGAGAGAATG Messenger 667 (GAM667) oligonucleotides modulates expression of respective target genes
AAAGGAGGTA whose function and utility is known in the art.

GCATGAGCAG GAM667 is a novel bioinformatically detectable regulatory, non protein coding,
GGCACTCAGC micro RNA (miRNA)-like oligonucleotide. The method by which GAM667 was detected is

TCGGAGGCAG described with additional reference to Figs. 9-15.

TGCCTAGCCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACATTGCTTA encoded by the human genome.

TCTTCACTGT GAM667 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM667

GAATTTGGCT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM667
TTTTTCCTAC precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar TCTTGAATCT to the nucleotide sequence of GAM667 precursor RNA is designated SEQ ID:6906, and is

T provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6906 is located from position 44371974 to position 44372104 relative to chromosome 7 on the `+` strand.

GAM667 precursor RNA folds onto itself, forming GAM667 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM667 precursor RNA, designated SEQ ID NO: 6906, and a schematic representation of a predicted secondary folding of GAM667 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM667 folded precursor RNA yielding a GAM667 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM667 RNA, hereby incorporated herein.

GAM667 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM667 target RNA, herein designated GAM TARGET RNA. GAM667 target RNA
comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM667 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM667 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM667 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM667 RNA, herein designated GAM RNA, to target binding sites on GAM667 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE

I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM667 target RNA into GAM667 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM667 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM667 target genes. The mRNA of each one of this plurality of GAM667 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM667 RNA, herein designated GAM RNA, and which when bound by GAM667 RNA causes inhibition of translation of the GAM667 target mRNA into a corresponding GAM667 target protein.

The mechanism of the translational inhibition exerted by GAM667 RNA, herein designated GAM RNA, on one or more GAM667 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM667 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM667 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM667 RNA, herein designated GAM RNA, of GAM667 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM667 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM667 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM667 RNA correlate with, and may be deduced from, the identity of the GAM667 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM674 5993 CACAGCCAGT Fig. 8 further provides a conceptual description of another novel bioinformatically

TTCTTTGATG detected oligonucleotides of the present invention, referred to here as Genomic Address

ACTCAAAACG Messenger 674 (GAM674) oligonucleotides modulates expression of respective target genes

TACTTTGTGA whose function and utility is known in the art.

TCTTGCCAAG GAM674 is a novel bioinformatically detectable regulatory, non protein coding,

CTTTGAGATC micro RNA (miRNA)-like oligonucleotide. The method by which GAM674 was detected is

ATCGTTACAA described with additional reference to Figs. 9-15.

GCAGCATTTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGTTGTG encoded by the human genome.

GAM674 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM674 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM674 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM674 precursor RNA is designated SEQ ID:5993, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5993 is located from position 43395844 to position 43395930 relative to chromosome 17 on the `+` strand.

GAM674 precursor RNA folds onto itself, forming GAM674 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM674 precursor RNA, designated SEQ ID NO: 5993, and a schematic representation of a predicted secondary folding of GAM674 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM674 folded precursor RNA yielding a GAM674 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM674 RNA, hereby incorporated herein.

GAM674 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM674 target RNA, herein designated GAM TARGET RNA. GAM674 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM674 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM674 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM674 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in

the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM674 RNA, herein designated GAM RNA, to target binding sites on GAM674 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM674 target RNA into GAM674 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM674 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM674 target genes. The mRNA of each one of this plurality of GAM674 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM674 RNA, herein designated GAM RNA, and which when bound by GAM674 RNA causes inhibition of translation of the GAM674 target mRNA into a corresponding GAM674 target protein.

The mechanism of the translational inhibition exerted by GAM674 RNA, herein designated GAM RNA, on one or more GAM674 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM674 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM674 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM674 RNA, herein designated GAM RNA, of GAM674 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM674 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM674 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM674 RNA correlate with, and may be deduced from, the identity of the GAM674 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM689 6376 GAGGCAGGAA Fig. 8 further provides a conceptual description of another novel bioinformatically
AATCGCTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address
ACCCAAGGCA Messenger 689 (GAM689) oligonucleotides modulates expression of respective target genes
GAGGTTGCAG whose function and utility is known in the art.

TCAGCAGATA GAM689 is a novel bioinformatically detectable regulatory, non protein coding, TTGCACCACT micro RNA (miRNA)-like oligonucleotide. The method by which GAM689 was detected is

GCACTCCAGC described with additional reference to Figs. 9-15.

CTGGGCAACA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AAGCAAGACT encoded by the human genome.

CTGCCTC GAM689 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM689

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM689

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM689 precursor RNA is designated SEQ ID:6376, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6376 is located from position 69076605 to position 69076701 relative to chromosome 5 on the `-` strand.

GAM689 precursor RNA folds onto itself, forming GAM689 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM689 precursor RNA, designated SEQ ID NO: 6376, and a schematic representation of a predicted secondary folding of GAM689 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM689 folded precursor RNA yielding a GAM689 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM689 RNA, hereby incorporated herein. Expression of GAM689 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM689 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM689 target RNA, herein designated GAM TARGET RNA. GAM689 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM689 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM689 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM689 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM689 RNA, herein designated GAM RNA, to target binding sites on GAM689 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM689 target RNA into GAM689 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM689 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM689 target genes. The mRNA of each one of this plurality of GAM689 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM689 RNA, herein designated GAM RNA, and which when bound by GAM689 RNA causes inhibition of translation of the GAM689 target mRNA into a corresponding GAM689 target protein.

The mechanism of the translational inhibition exerted by GAM689 RNA, herein designated GAM RNA, on one or more GAM689 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM689 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM689 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM689 RNA, herein designated GAM RNA, of GAM689 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM689 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM689 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM689 RNA correlate with, and may be deduced from, the identity of the GAM689 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM744 5804 AGTCACTGGA Fig. 8 further provides a conceptual description of another novel bioinformatically
AAATGCTTAC detected oligonucleotides of the present invention, referred to here as Genomic Address
AGGCAGTAGC Messenger 744 (GAM744) oligonucleotides modulates expression of respective target genes
CACCATCATG whose function and utility is known in the art.

TGGCACAAAG GAM744 is a novel bioinformatically detectable regulatory, non protein coding,
TGGGCATCAT micro RNA (miRNA)-like oligonucleotide. The method by which GAM744 was detected is

CCTAGTGTCT described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM744 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM744

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM744
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM744 precursor RNA is designated SEQ ID:5804, and is provided hereinbelow with reference to the sequence listing part.

GAM744 precursor RNA folds onto itself, forming GAM744 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM744 precursor RNA, designated SEQ ID NO: 5804, and a schematic representation of a predicted secondary folding of GAM744 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM744 folded precursor RNA yielding a GAM744 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM744 RNA, hereby incorporated herein. Expression of GAM744 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM744 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM744 target RNA, herein designated GAM TARGET RNA. GAM744 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM744 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM744 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM744 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM744 RNA, herein designated GAM RNA, to target binding sites on GAM744 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM744 target RNA into GAM744 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM744 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM744 target genes. The mRNA of each one of this plurality of GAM744 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM744 RNA, herein designated GAM RNA, and which when bound by GAM744 RNA causes inhibition of translation of the GAM744 target mRNA into a corresponding GAM744 target protein.

The mechanism of the translational inhibition exerted by GAM744 RNA, herein designated GAM RNA, on one or more GAM744 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM744 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM744 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM744 RNA, herein designated GAM RNA, of GAM744 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM744 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM744 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7,

incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM744 RNA correlate with, and may be deduced from, the identity of the GAM744 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TGAGAAGCTT GAM750 is a novel bioinformatically detectable regulatory, non protein coding,
GTTTATTTGA micro RNA (miRNA)-like oligonucleotide. The method by which GAM750 was detected is

AGGCTGGGTT described with additional reference to Figs. 9-15.

CTCATTGGCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CACAGGGGTA encoded by the human genome.

GGTTGTAATT GAM750 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM750
GTGT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM750

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM750 precursor RNA is designated SEQ ID:5683, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5683 is located from position 46615364 to position 46615467 relative to chromosome 20 on the `-` strand.

GAM750 precursor RNA folds onto itself, forming GAM750 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM750 precursor RNA, designated SEQ ID NO: 5683, and a schematic representation of a predicted secondary folding of GAM750 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM750 folded precursor RNA yielding a GAM750 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a

nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM750 RNA, hereby incorporated herein.

GAM750 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM750 target RNA, herein designated GAM TARGET RNA. GAM750 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM750 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM750 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM750 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM750 RNA, herein designated GAM RNA, to target binding sites on GAM750 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM750 target RNA into GAM750 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM750 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM750 target genes. The mRNA of each one of this plurality of GAM750 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM750 RNA, herein designated GAM RNA, and which when bound by GAM750 RNA causes inhibition of translation of the GAM750 target mRNA into a corresponding GAM750 target protein.

The mechanism of the translational inhibition exerted by GAM750 RNA, herein designated GAM RNA, on one or more GAM750 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM750 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM750 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM750 RNA, herein designated GAM RNA, of GAM750 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM750 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM750 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM750 RNA correlate with, and may be deduced from, the identity of the GAM750 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM760 7046 TCGCAGTCAG Fig. 8 further provides a conceptual description of another novel bioinformatically

ACGTTTGGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

ACAGCAGTGG Messenger 760 (GAM760) oligonucleotides modulates expression of respective target genes

AAGAGGCAAC whose function and utility is known in the art.

TGGTGCTTTT GAM760 is a novel bioinformatically detectable regulatory, non protein coding,

CAGCTAGGCC micro RNA (miRNA)-like oligonucleotide. The method by which GAM760 was detected is

TTGAAAAATT described with additional reference to Figs. 9-15.

GCTTCAGAGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTGATTTCGA encoded by the human genome.

GAM760 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM760

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM760

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM760 precursor RNA is designated SEQ ID:7046, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7046 is located from position 15036029 to position 15036118 relative to chromosome 10 on the `+` strand.

GAM760 precursor RNA folds onto itself, forming GAM760 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM760 precursor RNA, designated SEQ ID NO: 7046, and a schematic representation of a predicted secondary folding of GAM760 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM760 folded precursor RNA yielding a GAM760 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM760 RNA, hereby incorporated herein.

GAM760 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM760 target RNA, herein designated GAM TARGET RNA. GAM760 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM760 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM760 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM760 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM760 RNA, herein designated GAM RNA, to target binding sites on GAM760 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM760 target RNA into GAM760 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM760 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM760 target genes. The mRNA of each one of this plurality of GAM760 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM760 RNA, herein designated GAM RNA, and which when bound by GAM760 RNA causes inhibition of translation of the GAM760 target mRNA into a corresponding GAM760 target protein.

The mechanism of the translational inhibition exerted by GAM760 RNA, herein designated GAM RNA, on one or more GAM760 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM760 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM760 folded precursor RNA, herein

designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM760 RNA, herein designated GAM RNA, of GAM760 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM760 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM760 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM760 RNA correlate with, and may be deduced from, the identity of the GAM760 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 772 (GAM772) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM772 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM772 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM772 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM772 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM772 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM772 precursor RNA is designated SEQ ID:7223, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7223 is located from position 26891775 to position 26891870 relative to chromosome 17 on the `+` strand.

GAM772 precursor RNA folds onto itself, forming GAM772 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of

the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM772 precursor RNA, designated SEQ ID NO: 7223, and a schematic representation of a predicted secondary folding of GAM772 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM772 folded precursor RNA yielding a GAM772 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM772 RNA, hereby incorporated herein.

GAM772 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM772 target RNA, herein designated GAM TARGET RNA. GAM772 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM772 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM772 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM772 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM772 RNA, herein designated GAM RNA, to target binding sites on GAM772 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM772 target RNA into GAM772 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM772 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM772 target genes. The mRNA of each one of this plurality of GAM772 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM772 RNA, herein designated GAM RNA, and which when bound by GAM772 RNA causes inhibition of translation of the GAM772 target mRNA into a corresponding GAM772 target protein.

The mechanism of the translational inhibition exerted by GAM772 RNA, herein designated GAM RNA, on one or more GAM772 target genes, herein collectively designated GAM

TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM772 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM772 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM772 RNA, herein designated GAM RNA, of GAM772 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM772 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM772 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM772 RNA correlate with, and may be deduced from, the identity of the GAM772 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CCCTTCATAC Messenger 779 (GAM779) oligonucleotides modulates expression of respective target genes

CCTTTCATTA whose function and utility is known in the art.

GTAGCTCTAA GAM779 is a novel bioinformatically detectable regulatory, non protein coding,

GATGTTTGAT micro RNA (miRNA)-like oligonucleotide. The method by which GAM779 was detected is

TAAGGTGTAC described with additional reference to Figs. 9-15.

GTTTACAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGTTGGTTG encoded by the human genome.

GTGATGAGCA GAM779 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM779

TTGAACATTT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM779

GGGTTCTTCG precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar

G to the nucleotide sequence of GAM779 precursor RNA is designated SEQ ID:6097, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6097 is located from position 131264455 to position 131264575 relative to chromosome 10 on the `+` strand.

GAM779 precursor RNA folds onto itself, forming GAM779 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM779 precursor RNA, designated SEQ ID NO: 6097, and a schematic representation of a predicted secondary folding of GAM779 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM779 folded precursor RNA yielding a GAM779 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM779 RNA, hereby incorporated herein.

GAM779 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM779 target RNA, herein designated GAM TARGET RNA. GAM779 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM779 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM779 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM779 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM779 RNA, herein designated GAM RNA, to target binding sites on GAM779 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM779 target RNA into GAM779 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM779 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM779 target genes. The mRNA of each one of this plurality of GAM779 target genes comprises one or more target binding sites, each having a

nucleotide sequence which is at least partly complementary to GAM779 RNA, herein designated GAM RNA, and which when bound by GAM779 RNA causes inhibition of translation of the GAM779 target mRNA into a corresponding GAM779 target protein.

The mechanism of the translational inhibition exerted by GAM779 RNA, herein designated GAM RNA, on one or more GAM779 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM779 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM779 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM779 RNA, herein designated GAM RNA, of GAM779 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM779 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM779 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM779 RNA correlate with, and may be deduced from, the identity of the GAM779 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

AACAGGGAAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTCTGTCCCT encoded by the human genome.

ATCTATAAAA GAM785 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM785
TAAACGGG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM785

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM785 precursor RNA is designated SEQ ID:6082, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6082 is located from position 30319064 to position 30319171 relative to chromosome 17 on the `+` strand.

GAM785 precursor RNA folds onto itself, forming GAM785 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM785 precursor RNA, designated SEQ ID NO: 6082, and a schematic representation of a predicted secondary folding of GAM785 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM785 folded precursor RNA yielding a GAM785 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM785 RNA, hereby incorporated herein.

GAM785 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM785 target RNA, herein designated GAM TARGET RNA. GAM785 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM785 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM785 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM785 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM785 RNA, herein designated GAM RNA, to target binding sites on GAM785 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM785 target RNA into GAM785 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by

a broken line.

It is appreciated that GAM785 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM785 target genes. The mRNA of each one of this plurality of GAM785 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM785 RNA, herein designated GAM RNA, and which when bound by GAM785 RNA causes inhibition of translation of the GAM785 target mRNA into a corresponding GAM785 target protein.

The mechanism of the translational inhibition exerted by GAM785 RNA, herein designated GAM RNA, on one or more GAM785 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM785 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM785 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM785 RNA, herein designated GAM RNA, of GAM785 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM785 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM785 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM785 RNA correlate with, and may be deduced from, the identity of the GAM785 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TGTATTGTGC Messenger 801 (GAM801) oligonucleotides modulates expression of respective target genes

TTGTACTGAC whose function and utility is known in the art.

CATGTATATA GAM801 is a novel bioinformatically detectable regulatory, non protein coding,

TGCTATGGTT micro RNA (miRNA)-like oligonucleotide. The method by which GAM801 was detected is

ATTTAGTGCT described with additional reference to Figs. 9-15.

AGCTAAGAAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ATACCATTTC encoded by the human genome.

CCCAGTAGCA GAM801 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM801

GTC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM801

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM801 precursor RNA is designated SEQ ID:6307, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6307 is located from position 53583235 to position 53583337 relative to chromosome 12 on the `+` strand.

GAM801 precursor RNA folds onto itself, forming GAM801 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM801 precursor RNA, designated SEQ ID NO: 6307, and a schematic representation of a predicted secondary folding of GAM801 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM801 folded precursor RNA yielding a GAM801 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM801 RNA, hereby incorporated herein.

GAM801 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM801 target RNA, herein designated GAM TARGET RNA. GAM801 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM801 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM801 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM801 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM801 RNA, herein designated GAM RNA, to target binding sites on GAM801 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM801 target RNA into GAM801 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM801 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM801 target genes. The mRNA of each one of this plurality of GAM801 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM801 RNA, herein designated GAM RNA, and which when bound by GAM801 RNA causes inhibition of translation of the GAM801 target mRNA into a corresponding GAM801 target protein.

The mechanism of the translational inhibition exerted by GAM801 RNA, herein designated GAM RNA, on one or more GAM801 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM801 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM801 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM801 RNA, herein designated GAM RNA, of GAM801 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM801 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM801 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM801 RNA correlate with, and may be deduced from, the identity of the GAM801 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM807 7089 TGACAATCTT GGTTACCATC CATTAAGTGC TGCTGATTTT GGAAAGATCA Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 807 (GAM807) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM807 is a novel bioinformatically detectable regulatory, non protein coding,

TGAAAAACGT micro RNA (miRNA)-like oligonucleotide. The method by which GAM807 was detected is

CTTTCCAAAC described with additional reference to Figs. 9-15.

ATGAAGGCAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GTCGTTTGGG encoded by the human genome.

CACAAGAGGC GAM807 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM807

A precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM807

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM807 precursor RNA is designated SEQ ID:7089, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7089 is located from position 53974897 to position 53974997 relative to chromosome 15 on the `-` strand.

GAM807 precursor RNA folds onto itself, forming GAM807 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM807 precursor RNA, designated SEQ ID NO: 7089, and a schematic representation of a predicted secondary folding of GAM807 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM807 folded precursor RNA yielding a GAM807 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM807 RNA, hereby incorporated herein.

GAM807 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM807 target RNA, herein designated GAM TARGET RNA. GAM807 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM807 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM807 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM807 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows

three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM807 RNA, herein designated GAM RNA, to target binding sites on GAM807 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE

I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM807 target RNA into GAM807 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM807 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM807 target genes. The mRNA of each one of this plurality of GAM807 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM807 RNA, herein designated GAM RNA, and which when bound by GAM807 RNA causes inhibition of translation of the GAM807 target mRNA into a corresponding GAM807 target protein.

The mechanism of the translational inhibition exerted by GAM807 RNA, herein designated GAM RNA, on one or more GAM807 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM807 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM807 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM807 RNA, herein designated GAM RNA, of GAM807 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM807 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM807 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM807 RNA correlate with, and may be deduced from, the identity of the GAM807 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM821 6140 CGCTGCCTCT Fig. 8 further provides a conceptual description of another novel bioinformatically

CTGCAGGCCG detected oligonucleotides of the present invention, referred to here as Genomic Address
TGTGCTTTGC Messenger 821 (GAM821) oligonucleotides modulates expression of respective target genes
TCGGTTGATC whose function and utility is known in the art.

TTGCAGAGCC GAM821 is a novel bioinformatically detectable regulatory, non protein coding,
TAAGACACAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM821 was detected is

GCCCAGAGAG described with additional reference to Figs. 9-15.

GCAGTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM821 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM821

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM821
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM821 precursor RNA is designated SEQ ID:6140, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6140 is located from position 50818309 to position 50818384 relative to chromosome 19 on the `+` strand.

GAM821 precursor RNA folds onto itself, forming GAM821 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM821 precursor RNA, designated SEQ ID NO: 6140, and a schematic representation of a predicted secondary folding of GAM821 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM821 folded precursor RNA yielding a GAM821 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM821 RNA, hereby incorporated herein.

GAM821 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM821 target RNA, herein designated GAM TARGET RNA. GAM821 target RNA
comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM821 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM821 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM821 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM821 RNA, herein designated GAM RNA, to target binding sites on GAM821 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM821 target RNA into GAM821 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM821 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM821 target genes. The mRNA of each one of this plurality of GAM821 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM821 RNA, herein designated GAM RNA, and which when bound by GAM821 RNA causes inhibition of translation of the GAM821 target mRNA into a corresponding GAM821 target protein.

The mechanism of the translational inhibition exerted by GAM821 RNA, herein designated GAM RNA, on one or more GAM821 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM821 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM821 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM821 RNA, herein designated GAM RNA, of GAM821 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM821 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM821 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM821 RNA

correlate with, and may be deduced from, the identity of the GAM821 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM828 5710 ACTGGAGACA Fig. 8 further provides a conceptual description of another novel bioinformatically
CATCTAATGG detected oligonucleotides of the present invention, referred to here as Genomic Address
CTGTGCTGAT Messenger 828 (GAM828) oligonucleotides modulates expression of respective target genes
GTCAAGGGAC whose function and utility is known in the art.

TTTCTAATCA GAM828 is a novel bioinformatically detectable regulatory, non protein coding,
TGTTCATCAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM828 was detected is

TTGATAGCAG described with additional reference to Figs. 9-15.

ATGCTGTTTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAGT encoded by the human genome.

GAM828 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM828

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM828

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM828 precursor RNA is designated SEQ ID:5710, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5710 is located from position 14758025 to position 14758108 relative to chromosome Y on the `-` strand.

GAM828 precursor RNA folds onto itself, forming GAM828 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM828 precursor RNA, designated SEQ ID NO: 5710, and a schematic representation of a predicted secondary folding of GAM828 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM828 folded precursor RNA yielding a GAM828 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM828 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM828 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM828 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM828 target RNA, herein designated GAM TARGET RNA. GAM828 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM828 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM828 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM828 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM828 RNA, herein designated GAM RNA, to target binding sites on GAM828 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM828 target RNA into GAM828 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM828 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM828 target genes. The mRNA of each one of this plurality of GAM828 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM828 RNA, herein designated GAM RNA, and which when bound by GAM828 RNA causes inhibition of translation of the GAM828 target mRNA into a corresponding GAM828 target protein.

The mechanism of the translational inhibition exerted by GAM828 RNA, herein designated GAM RNA, on one or more GAM828 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM828 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM828 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM828 RNA, herein designated GAM RNA, of GAM828 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM828 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM828 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM842

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM842 precursor RNA is designated SEQ ID:6233, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6233 is located from position 1319182 to position 1319274 relative to chromosome 17 on the `-` strand.

GAM842 precursor RNA folds onto itself, forming GAM842 folded precursor RNA,

herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM842 precursor RNA, designated SEQ ID NO: 6233, and a schematic representation of a predicted secondary folding of GAM842 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM842 folded precursor RNA yielding a GAM842 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM842 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM842 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM842 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM842 target RNA, herein designated GAM TARGET RNA. GAM842 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM842 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM842 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM842 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM842 RNA, herein designated GAM RNA, to target binding sites on GAM842 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM842 target RNA into GAM842 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM842 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM842 target genes. The mRNA of each one of this plurality of GAM842 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM842 RNA, herein

designated GAM RNA, and which when bound by GAM842 RNA causes inhibition of translation of the GAM842 target mRNA into a corresponding GAM842 target protein.

The mechanism of the translational inhibition exerted by GAM842 RNA, herein designated GAM RNA, on one or more GAM842 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM842 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM842 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM842 RNA, herein designated GAM RNA, of GAM842 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM842 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM842 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM842 RNA correlate with, and may be deduced from, the identity of the GAM842 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM846 7044 TCCTGTGCTG Fig. 8 further provides a conceptual description of another novel bioinformatically
CAGTAGAAAT detected oligonucleotides of the present invention, referred to here as Genomic Address
TAGAGCATGT Messenger 846 (GAM846) oligonucleotides modulates expression of respective target genes
CCTGCTTTAT whose function and utility is known in the art.

GCAGGCTTTG GAM846 is a novel bioinformatically detectable regulatory, non protein coding,
CTTTAGTTCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM846 was detected is

TCTGAAGTGT described with additional reference to Figs. 9-15.

ATGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM846 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM846

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM846

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM846 precursor RNA is designated SEQ ID:7044, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7044 is located from position 127720318 to position 127720391 relative to chromosome 9 on the `+` strand.

GAM846 precursor RNA folds onto itself, forming GAM846 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM846 precursor RNA, designated SEQ ID NO: 7044, and a schematic representation of a predicted secondary folding of GAM846 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM846 folded precursor RNA yielding a GAM846 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM846 RNA, hereby incorporated herein.

GAM846 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM846 target RNA, herein designated GAM TARGET RNA. GAM846 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM846 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM846 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM846 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM846 RNA, herein designated GAM RNA, to target binding sites on GAM846 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE

I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM846 target RNA into GAM846 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by

a broken line.

It is appreciated that GAM846 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM846 target genes. The mRNA of each one of this plurality of GAM846 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM846 RNA, herein designated GAM RNA, and which when bound by GAM846 RNA causes inhibition of translation of the GAM846 target mRNA into a corresponding GAM846 target protein.

The mechanism of the translational inhibition exerted by GAM846 RNA, herein designated GAM RNA, on one or more GAM846 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM846 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM846 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM846 RNA, herein designated GAM RNA, of GAM846 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM846 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM846 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM846 RNA correlate with, and may be deduced from, the identity of the GAM846 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM869 6574 GGAAAGAATA Fig. 8 further provides a conceptual description of another novel bioinformatically
AAGGCTTGGA detected oligonucleotides of the present invention, referred to here as Genomic Address
CTCAGCCTAG Messenger 869 (GAM869) oligonucleotides modulates expression of respective target genes
GTTCAAGTAC whose function and utility is known in the art.

TGCATCTTGA GAM869 is a novel bioinformatically detectable regulatory, non protein coding,
CCTGGCCTGT micro RNA (miRNA)-like oligonucleotide. The method by which GAM869 was detected is

AGGCAAGTCT described with additional reference to Figs. 9-15.

TTTCACTTCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

C encoded by the human genome.

GAM869 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM869 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM869 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM869 precursor RNA is designated SEQ ID:6574, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6574 is located from position 43962141 to position 43962221 relative to chromosome 20 on the `-` strand.

GAM869 precursor RNA folds onto itself, forming GAM869 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM869 precursor RNA, designated SEQ ID NO: 6574, and a schematic representation of a predicted secondary folding of GAM869 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM869 folded precursor RNA yielding a GAM869 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM869 RNA, hereby incorporated herein.

GAM869 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM869 target RNA, herein designated GAM TARGET RNA. GAM869 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM869 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM869 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM869 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM869 RNA, herein designated GAM RNA, to target binding sites on GAM869 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM869 target RNA into GAM869 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM869 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM869 target genes. The mRNA of each one of this plurality of GAM869 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM869 RNA, herein designated GAM RNA, and which when bound by GAM869 RNA causes inhibition of translation of the GAM869 target mRNA into a corresponding GAM869 target protein.

The mechanism of the translational inhibition exerted by GAM869 RNA, herein designated GAM RNA, on one or more GAM869 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM869 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM869 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM869 RNA, herein designated GAM RNA, of GAM869 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM869 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM869 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM869 RNA correlate with, and may be deduced from, the identity of the GAM869 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

AGATAAAGGC Messenger 965 (GAM965) oligonucleotides modulates expression of respective target genes
TTCACGTGGT whose function and utility is known in the art.

GTTTGGCATG GAM965 is a novel bioinformatically detectable regulatory, non protein coding,
GCGTAGGTGT micro RNA (miRNA)-like oligonucleotide. The method by which GAM965 was detected is

AGATTGGACC described with additional reference to Figs. 9-15.

TCAGTTTTCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GCCCA encoded by the human genome.

GAM965 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM965

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM965

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM965 precursor RNA is designated SEQ ID:7245, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7245 is located from position 46553864 to position 46553948 relative to chromosome 12 on the `+` strand.

GAM965 precursor RNA folds onto itself, forming GAM965 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM965 precursor RNA, designated SEQ ID NO: 7245, and a schematic representation of a predicted secondary folding of GAM965 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM965 folded precursor RNA yielding a GAM965 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM965 RNA, hereby incorporated herein.

GAM965 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM965 target RNA, herein designated GAM TARGET RNA. GAM965 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM965 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM965 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM965 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM965 RNA, herein designated GAM RNA, to target binding sites on GAM965 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM965 target RNA into GAM965 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM965 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM965 target genes. The mRNA of each one of this plurality of GAM965 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM965 RNA, herein designated GAM RNA, and which when bound by GAM965 RNA causes inhibition of translation of the GAM965 target mRNA into a corresponding GAM965 target protein.

The mechanism of the translational inhibition exerted by GAM965 RNA, herein designated GAM RNA, on one or more GAM965 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM965 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM965 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM965 RNA, herein designated GAM RNA, of GAM965 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM965 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM965 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM965 RNA correlate with, and may be deduced from, the identity of the GAM965 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM973 5671 AAGTGCTGGA Fig. 8 further provides a conceptual description of another novel bioinformatically
TATTGCTAAG detected oligonucleotides of the present invention, referred to here as Genomic Address
AATTCAGGTA Messenger 973 (GAM973) oligonucleotides modulates expression of respective target genes
GTCTCGGGAT whose function and utility is known in the art.

CTCCAGAGTC GAM973 is a novel bioinformatically detectable regulatory, non protein coding,
TCCATACTAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM973 was detected is

GACAGGAGAT described with additional reference to Figs. 9-15.

CTTCAGAACC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGGAGGAATG encoded by the human genome.

GAAATAGTCT GAM973 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM973
AGTCAGCTT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM973
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM973 precursor RNA is designated SEQ ID:5671, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5671 is located from position 150223532 to position 150223640 relative to chromosome 7 on the `-` strand.

GAM973 precursor RNA folds onto itself, forming GAM973 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM973 precursor RNA, designated SEQ ID NO: 5671, and a schematic representation of a predicted secondary folding of GAM973 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM973 folded precursor RNA yielding a GAM973 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM973 RNA, hereby incorporated herein.

GAM973 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM973 target RNA, herein designated GAM TARGET RNA. GAM973 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM973 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM973 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM973 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM973 RNA, herein designated GAM RNA, to target binding sites on GAM973 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM973 target RNA into GAM973 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM973 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM973 target genes. The mRNA of each one of this plurality of GAM973 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM973 RNA, herein designated GAM RNA, and which when bound by GAM973 RNA causes inhibition of translation of the GAM973 target mRNA into a corresponding GAM973 target protein.

The mechanism of the translational inhibition exerted by GAM973 RNA, herein designated GAM RNA, on one or more GAM973 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM973 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM973 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM973 RNA, herein designated GAM RNA, of GAM973 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM973 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM973 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM973 RNA correlate with, and may be deduced from, the identity of the GAM973 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM999 5722 AGACCACCTT Fig. 8 further provides a conceptual description of another novel bioinformatically
ATTCTTTTCT detected oligonucleotides of the present invention, referred to here as Genomic Address
TATGGGTATG Messenger 999 (GAM999) oligonucleotides modulates expression of respective target genes
TGGCATGAAT whose function and utility is known in the art.

GCCATCATTT GAM999 is a novel bioinformatically detectable regulatory, non protein coding,
ATTTACCCAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM999 was detected is

CTGCCAGTTG described with additional reference to Figs. 9-15.

AAGAACATTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGGTCT encoded by the human genome.

GAM999 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM999

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM999

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM999 precursor RNA is designated SEQ ID:5722, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5722 is located from position 93949150 to position 93949235 relative to chromosome 11 on the `+` strand.

GAM999 precursor RNA folds onto itself, forming GAM999 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM999 precursor RNA, designated SEQ ID NO: 5722, and a

schematic representation of a predicted secondary folding of GAM999 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM999 folded precursor RNA yielding a GAM999 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM999 RNA, hereby incorporated herein.

GAM999 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM999 target RNA, herein designated GAM TARGET RNA. GAM999 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM999 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM999 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM999 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM999 RNA, herein designated GAM RNA, to target binding sites on GAM999 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM999 target RNA into GAM999 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM999 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM999 target genes. The mRNA of each one of this plurality of GAM999 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM999 RNA, herein designated GAM RNA, and which when bound by GAM999 RNA causes inhibition of translation of the GAM999 target mRNA into a corresponding GAM999 target protein.

The mechanism of the translational inhibition exerted by GAM999 RNA, herein designated GAM RNA, on one or more GAM999 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM999 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM999 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM999 RNA, herein designated GAM RNA, of GAM999 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM999 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM999 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM999 RNA correlate with, and may be deduced from, the identity of the GAM999 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1017 6666 GGAGAATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAATCTGG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGCGGAGG Messenger 1017 (GAM1017) oligonucleotides modulates expression of respective target genes

TTGCAGTGAG whose function and utility is known in the art.

CTGAGATCGC GAM1017 is a novel bioinformatically detectable regulatory, non protein coding,

ACCACTGCAC micro RNA (miRNA)-like oligonucleotide. The method by which GAM1017 was detected is

TCCAGCCTGT described with additional reference to Figs. 9-15.

TGACAGCGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ATTCC encoded by the human genome.

GAM1017 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1017

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1017

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1017 precursor RNA is designated SEQ ID:6666, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6666 is located from position 18499225 to position 18499309 relative to chromosome 20 on the `+` strand.

GAM1017 precursor RNA folds onto itself, forming GAM1017 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1017 precursor RNA, designated SEQ ID NO: 6666, and a schematic representation of a predicted secondary folding of GAM1017 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1017 folded precursor RNA yielding a GAM1017 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1017 RNA, hereby incorporated herein.

GAM1017 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1017 target RNA, herein designated GAM TARGET RNA. GAM1017 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1017 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1017 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1017 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1017 RNA, herein designated GAM RNA, to target binding sites on GAM1017 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1017 target RNA into GAM1017 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1017 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1017 target genes. The mRNA of each one of this plurality of GAM1017 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1017 RNA, herein designated GAM RNA, and which when bound by GAM1017 RNA causes inhibition of translation of the GAM1017 target mRNA into a corresponding GAM1017 target protein.

The mechanism of the translational inhibition exerted by GAM1017 RNA, herein designated GAM RNA, on one or more GAM1017 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1017 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1017 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1017 RNA, herein designated GAM RNA, of GAM1017 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1017 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1017 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1017 RNA correlate with, and may be deduced from, the identity of the GAM1017 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1032 6527 GCTAGTCACT Fig. 8 further provides a conceptual description of another novel bioinformatically
GGGGCAAAGA detected oligonucleotides of the present invention, referred to here as Genomic Address
TGACTAAAAC Messenger 1032 (GAM1032) oligonucleotides modulates expression of respective target genes
ACTTTTCCTG whose function and utility is known in the art.

CCCTCGAGGA GAM1032 is a novel bioinformatically detectable regulatory, non protein coding,
GCTCACAGTC micro RNA (miRNA)-like oligonucleotide. The method by which GAM1032 was detected is

TAGTATGTCT described with additional reference to Figs. 9-15.

CATCCCCTAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TAGACTGAAG encoded by the human genome.

CTCCTTGAGG GAM1032 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1032
ACAGGGATGG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1032
TCATACTCAC precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar
CTCGGTGTTG to the nucleotide sequence of GAM1032 precursor RNA is designated SEQ ID:6527, and is

C provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6527 is located from position 141427052 to position 141427182 relative to chromosome 8 on the `-` strand.

GAM1032 precursor RNA folds onto itself, forming GAM1032 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1032 precursor RNA, designated SEQ ID NO: 6527, and a schematic representation of a predicted secondary folding of GAM1032 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1032 folded precursor RNA yielding a GAM1032 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1032 RNA, hereby incorporated herein. Expression of GAM1032 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM1032 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1032 target RNA, herein designated GAM TARGET RNA. GAM1032 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1032 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1032 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1032 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1032 RNA, herein designated GAM RNA, to target binding sites on GAM1032 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1032 target RNA into GAM1032 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1032 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1032 target genes. The mRNA of each one of this plurality of GAM1032 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1032 RNA, herein designated GAM RNA, and which when bound by GAM1032 RNA causes inhibition of translation of the GAM1032 target mRNA into a corresponding GAM1032 target protein.

The mechanism of the translational inhibition exerted by GAM1032 RNA, herein designated GAM RNA, on one or more GAM1032 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1032 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1032 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1032 RNA, herein designated GAM RNA, of GAM1032 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1032 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1032 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1032 RNA correlate with, and may be deduced from, the identity of the GAM1032 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1033 6449 GAGGGGAGAT Fig. 8 further provides a conceptual description of another novel bioinformatically
TAAAGAATCA detected oligonucleotides of the present invention, referred to here as Genomic Address
ATGTTCCCAG Messenger 1033 (GAM1033) oligonucleotides modulates expression of respective target genes
GGGAAAAGGG whose function and utility is known in the art.

CCTTAAATTG GAM1033 is a novel bioinformatically detectable regulatory, non protein coding,
TTTGGTCTTT micro RNA (miRNA)-like oligonucleotide. The method by which GAM1033 was detected is

TCAATGGCTG described with additional reference to Figs. 9-15.

ACACTGTCTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAACTCTCCC encoded by the human genome.

CTT GAM1033 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1033 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1033 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1033 precursor RNA is designated SEQ ID:6449, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6449 is located from position 126882804 to position 126882896 relative to chromosome X on the `-` strand.

GAM1033 precursor RNA folds onto itself, forming GAM1033 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1033 precursor RNA, designated SEQ ID NO: 6449, and a schematic representation of a predicted secondary folding of GAM1033 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1033 folded precursor RNA yielding a GAM1033 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1033 RNA, hereby incorporated herein.

GAM1033 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1033 target RNA, herein designated GAM TARGET RNA. GAM1033 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1033 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1033 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1033 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1033 RNA, herein designated GAM RNA, to target binding sites on GAM1033 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1033 target RNA into GAM1033 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1033 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1033 target genes. The mRNA of each one of this plurality of GAM1033 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1033 RNA, herein designated GAM RNA, and which when bound by GAM1033 RNA causes inhibition of translation of the GAM1033 target mRNA into a corresponding GAM1033 target protein.

The mechanism of the translational inhibition exerted by GAM1033 RNA, herein designated GAM RNA, on one or more GAM1033 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1033 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1033 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1033 RNA, herein designated GAM RNA, of GAM1033 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1033 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1033 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1033 RNA correlate with, and may be deduced from, the identity of the GAM1033 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAGGCAATAT detected oligonucleotides of the present invention, referred to here as Genomic Address
CAATCCTTCT Messenger 1087 (GAM1087) oligonucleotides modulates expression of respective target genes
GCATCACACA whose function and utility is known in the art.

GTGGGAAAAG GAM1087 is a novel bioinformatically detectable regulatory, non protein coding,
TTTGTCTCAT micro RNA (miRNA)-like oligonucleotide. The method by which GAM1087 was detected is

TGCAGTTCTC described with additional reference to Figs. 9-15.

TTCCAAGCCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM1087 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1087 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1087 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1087 precursor RNA is designated SEQ ID:5796, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5796 is located from position 105533378 to position 105533457 relative to chromosome 10 on the `-` strand.

GAM1087 precursor RNA folds onto itself, forming GAM1087 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1087 precursor RNA, designated SEQ ID NO: 5796, and a schematic representation of a predicted secondary folding of GAM1087 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1087 folded precursor RNA yielding a GAM1087 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1087 RNA, hereby incorporated herein.

GAM1087 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1087 target RNA, herein designated GAM TARGET RNA. GAM1087 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1087 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1087 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1087 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1087 RNA, herein designated GAM RNA, to target binding sites on GAM1087 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1087 target RNA into GAM1087 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1087 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1087 target genes. The mRNA of each one of this plurality of GAM1087 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1087 RNA, herein designated GAM RNA, and which when bound by GAM1087 RNA causes inhibition of translation of the GAM1087 target mRNA into a corresponding GAM1087 target protein.

The mechanism of the translational inhibition exerted by GAM1087 RNA, herein designated GAM RNA, on one or more GAM1087 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1087 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1087 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1087 RNA, herein designated GAM RNA, of GAM1087 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1087 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1087 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1087 RNA correlate with, and may be deduced from, the identity of the GAM1087 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1088 6098 CCGCAGGGAG AAGAGCTGTG TGCTGTGATG Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 1088 (GAM1088) oligonucleotides modulates expression of respective target genes

TGGTTTATAA whose function and utility is known in the art.

ATTACCATTT GAM1088 is a novel bioinformatically detectable regulatory, non protein coding, GGAAGGAGCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM1088 was detected is

GCACAGCACA described with additional reference to Figs. 9-15.

GCAGCCTGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACTACTCTTC encoded by the human genome.

CTGAGG GAM1088 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1088 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1088 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1088 precursor RNA is designated SEQ ID:6098, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6098 is located from position 82179625 to position 82179720 relative to chromosome 7 on the `-` strand.

GAM1088 precursor RNA folds onto itself, forming GAM1088 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1088 precursor RNA, designated SEQ ID NO: 6098, and a schematic representation of a predicted secondary folding of GAM1088 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1088 folded precursor RNA yielding a GAM1088 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1088 RNA, hereby incorporated herein.

GAM1088 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1088 target RNA, herein designated GAM TARGET RNA. GAM1088 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1088 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1088 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1088 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1088 RNA, herein designated GAM RNA, to target binding sites on GAM1088 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1088 target RNA into GAM1088 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1088 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1088 target genes. The mRNA of each one of this plurality of GAM1088 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1088 RNA, herein designated GAM RNA, and which when bound by GAM1088 RNA causes inhibition of translation of the GAM1088 target mRNA into a corresponding GAM1088 target protein.

The mechanism of the translational inhibition exerted by GAM1088 RNA, herein designated GAM RNA, on one or more GAM1088 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1088 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1088 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1088 RNA, herein designated GAM RNA, of GAM1088 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1088 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1088 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1088 RNA correlate with, and may be deduced from, the identity of the GAM1088 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1089 6889 GTCTGAAATC Fig. 8 further provides a conceptual description of another novel bioinformatically

CAGGTGTGGG detected oligonucleotides of the present invention, referred to here as Genomic Address

CAGGGCCGTG Messenger 1089 (GAM1089) oligonucleotides modulates expression of respective target genes

CTCCCTCCGA whose function and utility is known in the art.

AGGCTCTAGG GAM1089 is a novel bioinformatically detectable regulatory, non protein coding,

GGAGGATCCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM1089 was detected is

TGCTCAACTT described with additional reference to Figs. 9-15.

ATTTTTGAGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

C encoded by the human genome.

GAM1089 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1089

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1089

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1089 precursor RNA is designated SEQ ID:6889, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6889 is located from position 114030793 to position 114030873 relative to chromosome 12 on the `-` strand.

GAM1089 precursor RNA folds onto itself, forming GAM1089 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1089 precursor RNA, designated SEQ ID NO: 6889, and a schematic representation of a predicted secondary folding of GAM1089 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1089 folded precursor RNA yielding a GAM1089 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM1089 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1089 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM1089 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1089 target RNA, herein designated GAM TARGET RNA. GAM1089 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1089 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1089 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1089 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1089 RNA, herein designated GAM RNA, to target binding sites on GAM1089 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1089 target RNA into GAM1089 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1089 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1089 target genes. The mRNA of each one of this plurality of GAM1089 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1089 RNA, herein designated GAM RNA, and which when bound by GAM1089 RNA causes inhibition of translation of the GAM1089 target mRNA into a corresponding GAM1089 target protein.

The mechanism of the translational inhibition exerted by GAM1089 RNA, herein designated GAM RNA, on one or more GAM1089 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1089 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1089 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1089 RNA, herein designated GAM RNA, of GAM1089 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1089 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1089 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1089 RNA correlate with, and may be deduced from, the identity of the GAM1089 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1099 6974 TAGTATGTTG Fig. 8 further provides a conceptual description of another novel bioinformatically
AGCATCTTTT detected oligonucleotides of the present invention, referred to here as Genomic Address

GTAGATCTTC GAM1099 is a novel bioinformatically detectable regulatory, non protein coding,
TTTGGTGAAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM1099 was detected is

TGTCTGTTCA described with additional reference to Figs. 9-15.

GATCTGTGTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CATTTTTAAT encoded by the human genome.

TGGGTTGTTT GAM1099 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1099
AACTTATTG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1099
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1099 precursor RNA is designated SEQ ID:6974, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6974 is located from position 46973081 to position 46973189 relative to chromosome 21 on the `+` strand.

GAM1099 precursor RNA folds onto itself, forming GAM1099 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1099 precursor RNA, designated SEQ ID NO: 6974, and a schematic representation of a predicted secondary folding of GAM1099 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1099 folded precursor RNA yielding a GAM1099 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the

nucleotide sequence of GAM1099 RNA, hereby incorporated herein.

GAM1099 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1099 target RNA, herein designated GAM TARGET RNA. GAM1099 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1099 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1099 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1099 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1099 RNA, herein designated GAM RNA, to target binding sites on GAM1099 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1099 target RNA into GAM1099 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1099 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1099 target genes. The mRNA of each one of this plurality of GAM1099 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1099 RNA, herein designated GAM RNA, and which when bound by GAM1099 RNA causes inhibition of translation of the GAM1099 target mRNA into a corresponding GAM1099 target protein.

The mechanism of the translational inhibition exerted by GAM1099 RNA, herein designated GAM RNA, on one or more GAM1099 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1099 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1099 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1099 RNA, herein designated GAM RNA, of GAM1099 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1099 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1099 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1099 RNA correlate with, and may be deduced from, the identity of the GAM1099 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

AATGGTGAAC micro RNA (miRNA)-like oligonucleotide. The method by which GAM1144 was detected is

ATTTTCCTTT described with additional reference to Figs. 9-15.

TCTTGGTGCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTTGCTGGAT encoded by the human genome.

GACTAGTGGT GAM1144 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1144

TTCTGCTGGA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1144

ACAGAG precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1144 precursor RNA is designated SEQ ID:6173, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6173 is located from position 26088289 to position 26088404 relative to chromosome 13 on the `+` strand.

GAM1144 precursor RNA folds onto itself, forming GAM1144 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1144 precursor RNA, designated SEQ ID NO: 6173, and a schematic representation of a predicted secondary folding of GAM1144 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1144 folded precursor RNA

yielding a GAM1144 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1144 RNA, hereby incorporated herein.

GAM1144 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1144 target RNA, herein designated GAM TARGET RNA. GAM1144 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1144 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1144 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1144 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1144 RNA, herein designated GAM RNA, to target binding sites on GAM1144 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1144 target RNA into GAM1144 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1144 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1144 target genes. The mRNA of each one of this plurality of GAM1144 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1144 RNA, herein designated GAM RNA, and which when bound by GAM1144 RNA causes inhibition of translation of the GAM1144 target mRNA into a corresponding GAM1144 target protein.

The mechanism of the translational inhibition exerted by GAM1144 RNA, herein designated GAM RNA, on one or more GAM1144 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1144 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1144 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1144 RNA, herein designated GAM RNA, of GAM1144 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1144 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1144 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1144 RNA correlate with, and may be deduced from, the identity of the GAM1144 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TATGAGAAAG whose function and utility is known in the art.

CAAACCCCAG GAM1163 is a novel bioinformatically detectable regulatory, non protein coding,

TGAGTGCTGC micro RNA (miRNA)-like oligonucleotide. The method by which GAM1163 was detected is

TTCGGGATTC described with additional reference to Figs. 9-15.

TCTCCAACTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAACCATGCC encoded by the human genome.

TAC GAM1163 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1163

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1163

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1163 precursor RNA is designated SEQ ID:6920, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6920 is located from position 92946370 to position 92946462 relative to chromosome 9 on the `+` strand.

GAM1163 precursor RNA folds onto itself, forming GAM1163 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1163 precursor RNA, designated SEQ ID NO: 6920, and a

schematic representation of a predicted secondary folding of GAM1163 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1163 folded precursor RNA yielding a GAM1163 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1163 RNA, hereby incorporated herein.

GAM1163 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1163 target RNA, herein designated GAM TARGET RNA. GAM1163 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1163 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1163 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1163 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1163 RNA, herein designated GAM RNA, to target binding sites on GAM1163 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1163 target RNA into GAM1163 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1163 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1163 target genes. The mRNA of each one of this plurality of GAM1163 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1163 RNA, herein designated GAM RNA, and which when bound by GAM1163 RNA causes inhibition of translation of the GAM1163 target mRNA into a corresponding GAM1163 target protein.

The mechanism of the translational inhibition exerted by GAM1163 RNA, herein designated GAM RNA, on one or more GAM1163 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1163 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1163 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1163 RNA, herein designated GAM RNA, of GAM1163 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1163 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1163 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1163 RNA correlate with, and may be deduced from, the identity of the GAM1163 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1191 7206 TGCTGGGCGT Fig. 8 further provides a conceptual description of another novel bioinformatically

GTGAGGCGGC detected oligonucleotides of the present invention, referred to here as Genomic Address

TGTGCTGTGC Messenger 1191 (GAM1191) oligonucleotides modulates expression of respective target genes

CTGTGAGACA whose function and utility is known in the art.

GGAATGGTTC GAM1191 is a novel bioinformatically detectable regulatory, non protein coding,

CATTACACCA micro RNA (miRNA)-like oligonucleotide. The method by which GAM1191 was detected is

TGGGAAATCA described with additional reference to Figs. 9-15.

CTGATTTATA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGTCCCAAAC encoded by the human genome.

TGCCACACAT GAM1191 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1191

CAGCA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1191

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1191 precursor RNA is designated SEQ ID:7206, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7206 is located from position 24390494 to position 24390598 relative to chromosome 13 on the `+` strand.

GAM1191 precursor RNA folds onto itself, forming GAM1191 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1191 precursor RNA, designated SEQ ID NO: 7206, and a schematic representation of a predicted secondary folding of GAM1191 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1191 folded precursor RNA yielding a GAM1191 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1191 RNA, hereby incorporated herein.

GAM1191 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1191 target RNA, herein designated GAM TARGET RNA. GAM1191 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1191 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1191 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1191 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1191 RNA, herein designated GAM RNA, to target binding sites on GAM1191 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1191 target RNA into GAM1191 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1191 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1191 target genes. The mRNA of each one of this plurality of GAM1191 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1191 RNA, herein designated GAM RNA, and which when bound by GAM1191 RNA causes inhibition of translation of the GAM1191 target mRNA into a corresponding GAM1191 target protein.

The mechanism of the translational inhibition exerted by GAM1191 RNA, herein

designated GAM RNA, on one or more GAM1191 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1191 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1191 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1191 RNA, herein designated GAM RNA, of GAM1191 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1191 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1191 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1191 RNA correlate with, and may be deduced from, the identity of the GAM1191 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1193 6364 GAGCTGGAGT Fig. 8 further provides a conceptual description of another novel bioinformatically
CTCGCTCTGT detected oligonucleotides of the present invention, referred to here as Genomic Address
CACCCAGGCT Messenger 1193 (GAM1193) oligonucleotides modulates expression of respective target genes
GGAGTGCAGT whose function and utility is known in the art.

GGTGCGATCT GAM1193 is a novel bioinformatically detectable regulatory, non protein coding,
TGGCTCACTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM1193 was detected is

CAACCTCCAC described with additional reference to Figs. 9-15.

CTTTGTGTTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AAGCAATTCT encoded by the human genome.

CCTTCCTC GAM1193 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1193
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1193
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1193 precursor RNA is designated SEQ ID:6364, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6364 is located from position 138504313 to position 138504410 relative to chromosome 7

on the `-` strand.

GAM1193 precursor RNA folds onto itself, forming GAM1193 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1193 precursor RNA, designated SEQ ID NO: 6364, and a schematic representation of a predicted secondary folding of GAM1193 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1193 folded precursor RNA yielding a GAM1193 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1193 RNA, hereby incorporated herein.

GAM1193 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1193 target RNA, herein designated GAM TARGET RNA. GAM1193 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1193 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1193 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1193 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1193 RNA, herein designated GAM RNA, to target binding sites on GAM1193 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1193 target RNA into GAM1193 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1193 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1193 target genes. The mRNA of each one of this plurality of GAM1193 target genes comprises one or more target binding sites, each having

a nucleotide sequence which is at least partly complementary to GAM1193 RNA, herein designated GAM RNA, and which when bound by GAM1193 RNA causes inhibition of translation of the GAM1193 target mRNA into a corresponding GAM1193 target protein.

The mechanism of the translational inhibition exerted by GAM1193 RNA, herein designated GAM RNA, on one or more GAM1193 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1193 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1193 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1193 RNA, herein designated GAM RNA, of GAM1193 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1193 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1193 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1193 RNA correlate with, and may be deduced from, the identity of the GAM1193 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1217 5699 ACCTGCCTAT ATTACATTCA TTTTGATGGT TTGTATCTCA AAGGAGTACA GTGAACGAAA

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 1217 (GAM1217) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM1217 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM1217 was detected is

CTTGTTTAAA described with additional reference to Figs. 9-15.

GATACACCGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AAAGAAAAAG encoded by the human genome.

AGAAGAGGCA GAM1217 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1217

GAGT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1217

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1217 precursor RNA is designated SEQ ID:5699, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5699 is located from position 88520253 to position 88520356 relative to chromosome 9 on the `+` strand.

GAM1217 precursor RNA folds onto itself, forming GAM1217 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1217 precursor RNA, designated SEQ ID NO: 5699, and a schematic representation of a predicted secondary folding of GAM1217 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1217 folded precursor RNA yielding a GAM1217 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1217 RNA, hereby incorporated herein.

GAM1217 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1217 target RNA, herein designated GAM TARGET RNA. GAM1217 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1217 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1217 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1217 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1217 RNA, herein designated GAM RNA, to target binding sites on GAM1217 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1217 target RNA into GAM1217 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1217 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1217 target genes. The mRNA of each one of this plurality of GAM1217 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1217 RNA, herein designated GAM RNA, and which when bound by GAM1217 RNA causes inhibition of translation of the GAM1217 target mRNA into a corresponding GAM1217 target protein.

The mechanism of the translational inhibition exerted by GAM1217 RNA, herein designated GAM RNA, on one or more GAM1217 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1217 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1217 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1217 RNA, herein designated GAM RNA, of GAM1217 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1217 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1217 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1217 RNA correlate with, and may be deduced from, the identity of the GAM1217 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1221 7086 TGAAGACTCC ATCACAGTTC CAGATGGGTA Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 1221 (GAM1221) oligonucleotides modulates expression of respective target genes

GGAATACCTT whose function and utility is known in the art.

GCAGGGCTGG GAM1221 is a novel bioinformatically detectable regulatory, non protein coding, GGCAAGGTAT micro RNA (miRNA)-like oligonucleotide. The method by which GAM1221 was detected is

TGCCTTCTCT described with additional reference to Figs. 9-15.

GGAAGGCTGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GCATTCTCTT encoded by the human genome.

CA GAM1221 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1221

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1221

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1221 precursor RNA is designated SEQ ID:7086, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7086 is located from position 26323250 to position 26323341 relative to chromosome 10 on the `+` strand.

GAM1221 precursor RNA folds onto itself, forming GAM1221 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1221 precursor RNA, designated SEQ ID NO: 7086, and a schematic representation of a predicted secondary folding of GAM1221 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1221 folded precursor RNA yielding a GAM1221 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1221 RNA, hereby incorporated herein.

GAM1221 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1221 target RNA, herein designated GAM TARGET RNA. GAM1221 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1221 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1221 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1221 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1221 RNA, herein designated GAM RNA, to target binding sites on GAM1221 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1221 target RNA into GAM1221 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1221 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1221 target genes. The mRNA of each one of this plurality of GAM1221 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1221 RNA, herein designated GAM RNA, and which when bound by GAM1221 RNA causes inhibition of translation of the GAM1221 target mRNA into a corresponding GAM1221 target protein.

The mechanism of the translational inhibition exerted by GAM1221 RNA, herein designated GAM RNA, on one or more GAM1221 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1221 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1221 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1221 RNA, herein designated GAM RNA, of GAM1221 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1221 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1221 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1221 RNA correlate with, and may be deduced from, the identity of the GAM1221 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1234 7276 TGTGGGGATC Fig. 8 further provides a conceptual description of another novel bioinformatically

TGGTGCTGTG detected oligonucleotides of the present invention, referred to here as Genomic Address

GTTCTGCATG Messenger 1234 (GAM1234) oligonucleotides modulates expression of respective target genes

AAGACAGTAA whose function and utility is known in the art.

CGGTGTCTTC GAM1234 is a novel bioinformatically detectable regulatory, non protein coding,

ATCCAGGAAC micro RNA (miRNA)-like oligonucleotide. The method by which GAM1234 was detected is

CACATTGTCT described with additional reference to Figs. 9-15.

GGACCTACA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM1234 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1234

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1234

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1234 precursor RNA is designated SEQ ID:7276, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7276 is located from position 138312903 to position 138312981 relative to chromosome 7 on the `-` strand.

GAM1234 precursor RNA folds onto itself, forming GAM1234 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1234 precursor RNA, designated SEQ ID NO: 7276, and a schematic representation of a predicted secondary folding of GAM1234 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1234 folded precursor RNA yielding a GAM1234 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM1234 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1234 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM1234 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1234 target RNA, herein designated GAM TARGET RNA. GAM1234 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1234 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1234 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1234 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1234 RNA, herein designated GAM RNA, to target binding sites on GAM1234 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1234 target RNA into GAM1234 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1234 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1234 target genes. The mRNA of each one of this plurality of GAM1234 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1234 RNA, herein designated GAM RNA, and which when bound by GAM1234 RNA causes inhibition of translation of the GAM1234 target mRNA into a corresponding GAM1234 target protein.

The mechanism of the translational inhibition exerted by GAM1234 RNA, herein designated GAM RNA, on one or more GAM1234 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1234 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1234 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1234 RNA, herein designated GAM RNA, of GAM1234 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1234 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1234 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1234 RNA correlate with, and may be deduced from, the identity of the GAM1234 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1238 6615 GGAGAATCAC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAACCTGG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGCAGAGG Messenger 1238 (GAM1238) oligonucleotides modulates expression of respective target genes

TTGTTGCAGT whose function and utility is known in the art.

GAGCCGAGAT GAM1238 is a novel bioinformatically detectable regulatory, non protein coding,

TGCACCACTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM1238 was detected is

CACTCCAGCC described with additional reference to Figs. 9-15.

TGGGTGACAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGTGAGACTC encoded by the human genome.

C GAM1238 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1238

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1238

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1238 precursor RNA is designated SEQ ID:6615, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6615 is located from position 56600621 to position 56600711 relative to chromosome 20 on the `-` strand.

GAM1238 precursor RNA folds onto itself, forming GAM1238 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1238 precursor RNA, designated SEQ ID NO: 6615, and a schematic representation of a predicted secondary folding of GAM1238 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1238 folded precursor RNA yielding a GAM1238 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the

nucleotide sequence of GAM1238 RNA, hereby incorporated herein.

GAM1238 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1238 target RNA, herein designated GAM TARGET RNA. GAM1238 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1238 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1238 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1238 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1238 RNA, herein designated GAM RNA, to target binding sites on GAM1238 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1238 target RNA into GAM1238 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1238 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1238 target genes. The mRNA of each one of this plurality of GAM1238 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1238 RNA, herein designated GAM RNA, and which when bound by GAM1238 RNA causes inhibition of translation of the GAM1238 target mRNA into a corresponding GAM1238 target protein.

The mechanism of the translational inhibition exerted by GAM1238 RNA, herein designated GAM RNA, on one or more GAM1238 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1238 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1238 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1238 RNA, herein designated GAM RNA, of GAM1238 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1238 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1238 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1238 RNA correlate with, and may be deduced from, the identity of the GAM1238 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CAAGCTGTGT detected oligonucleotides of the present invention, referred to here as Genomic Address
TAACTGTTCA Messenger 1293 (GAM1293) oligonucleotides modulates expression of respective target genes
AACTCAGGCC whose function and utility is known in the art.

TGTGTGACTC GAM1293 is a novel bioinformatically detectable regulatory, non protein coding,
CATTGGGGTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM1293 was detected is

AGAGGTGAAA described with additional reference to Figs. 9-15.

GCATAACATG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GGTACAGAGG encoded by the human genome.

GGACAAC GAM1293 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1293
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1293
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1293 precursor RNA is designated SEQ ID:6923, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6923 is located from position 56453734 to position 56453830 relative to chromosome 12 on the `-` strand.

GAM1293 precursor RNA folds onto itself, forming GAM1293 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1293 precursor RNA, designated SEQ ID NO: 6923, and a schematic representation of a predicted secondary folding of GAM1293 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1293 folded precursor RNA

yielding a GAM1293 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1293 RNA, hereby incorporated herein.

GAM1293 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1293 target RNA, herein designated GAM TARGET RNA. GAM1293 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1293 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1293 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1293 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1293 RNA, herein designated GAM RNA, to target binding sites on GAM1293 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1293 target RNA into GAM1293 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1293 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1293 target genes. The mRNA of each one of this plurality of GAM1293 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1293 RNA, herein designated GAM RNA, and which when bound by GAM1293 RNA causes inhibition of translation of the GAM1293 target mRNA into a corresponding GAM1293 target protein.

The mechanism of the translational inhibition exerted by GAM1293 RNA, herein designated GAM RNA, on one or more GAM1293 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1293 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1293 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1293 RNA, herein designated GAM RNA, of GAM1293 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1293 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1293 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1293 RNA correlate with, and may be deduced from, the identity of the GAM1293 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1294 6234 CTGGGTTCCC Fig. 8 further provides a conceptual description of another novel bioinformatically

AAATTCTCCT detected oligonucleotides of the present invention, referred to here as Genomic Address

TGCTGTTCTG Messenger 1294 (GAM1294) oligonucleotides modulates expression of respective target genes

CATCATTGTC whose function and utility is known in the art.

TAGATGGATT GAM1294 is a novel bioinformatically detectable regulatory, non protein coding,

AGTAAAGAAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM1294 was detected is

AATGAAAACT described with additional reference to Figs. 9-15.

CCAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM1294 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1294

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1294

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1294 precursor RNA is designated SEQ ID:6234, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6234 is located from position 74684805 to position 74684878 relative to chromosome 16 on the `-` strand.

GAM1294 precursor RNA folds onto itself, forming GAM1294 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1294 precursor RNA, designated SEQ ID NO: 6234, and a

schematic representation of a predicted secondary folding of GAM1294 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1294 folded precursor RNA yielding a GAM1294 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1294 RNA, hereby incorporated herein.

GAM1294 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1294 target RNA, herein designated GAM TARGET RNA. GAM1294 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1294 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1294 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1294 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1294 RNA, herein designated GAM RNA, to target binding sites on GAM1294 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1294 target RNA into GAM1294 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1294 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1294 target genes. The mRNA of each one of this plurality of GAM1294 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1294 RNA, herein designated GAM RNA, and which when bound by GAM1294 RNA causes inhibition of translation of the GAM1294 target mRNA into a corresponding GAM1294 target protein.

The mechanism of the translational inhibition exerted by GAM1294 RNA, herein designated GAM RNA, on one or more GAM1294 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1294 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1294 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

GGGAGAGAGG Messenger 1295 (GAM1295) oligonucleotides modulates expression of respective target genes
TAGAGGGGAG whose function and utility is known in the art.

CAGAGACAGC GAM1295 is a novel bioinformatically detectable regulatory, non protein coding,
CACCAGCTTC micro RNA (miRNA)-like oligonucleotide. The method by which GAM1295 was detected is

TATCTTCTGC described with additional reference to Figs. 9-15.

TCTAAGCACA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTCTTTCACG encoded by the human genome.

AGTTTAAGTT GAM1295 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1295
TCCTAGA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1295
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1295 precursor RNA is designated SEQ ID:7061, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7061 is located from position 40608762 to position 40608868 relative to chromosome 15 on the `+` strand.

GAM1295 precursor RNA folds onto itself, forming GAM1295 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1295 precursor RNA, designated SEQ ID NO: 7061, and a schematic representation of a predicted secondary folding of GAM1295 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1295 folded precursor RNA yielding a GAM1295 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1295 RNA, hereby incorporated herein.

GAM1295 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1295 target RNA, herein designated GAM TARGET RNA. GAM1295 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1295 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1295 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1295 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1295 RNA, herein designated GAM RNA, to target binding sites on GAM1295 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1295 target RNA into GAM1295 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1295 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1295 target genes. The mRNA of each one of this plurality of GAM1295 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1295 RNA, herein designated GAM RNA, and which when bound by GAM1295 RNA causes inhibition of translation of the GAM1295 target mRNA into a corresponding GAM1295 target protein.

The mechanism of the translational inhibition exerted by GAM1295 RNA, herein

designated GAM RNA, on one or more GAM1295 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1295 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1295 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1295 RNA, herein designated GAM RNA, of GAM1295 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1295 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1295 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1295 RNA correlate with, and may be deduced from, the identity of the GAM1295 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1300 7203 TGCTAGGCTT Fig. 8 further provides a conceptual description of another novel bioinformatically
ATTCTCTTCC detected oligonucleotides of the present invention, referred to here as Genomic Address
TCATTCAGTC Messenger 1300 (GAM1300) oligonucleotides modulates expression of respective target genes
TCTCAATCAA whose function and utility is known in the art.

TCAATACTTA GAM1300 is a novel bioinformatically detectable regulatory, non protein coding,
CTGAGTACTT micro RNA (miRNA)-like oligonucleotide. The method by which GAM1300 was detected is

GTCATTGCAA described with additional reference to Figs. 9-15.

GACCTGAGGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ATAGAGGGGC encoded by the human genome.

TAGCA GAM1300 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1300
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1300
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1300 precursor RNA is designated SEQ ID:7203, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7203 is located from position 82918189 to position 82918283 relative to chromosome 16

on the `+` strand.

GAM1300 precursor RNA folds onto itself, forming GAM1300 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1300 precursor RNA, designated SEQ ID NO: 7203, and a schematic representation of a predicted secondary folding of GAM1300 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1300 folded precursor RNA yielding a GAM1300 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1300 RNA, hereby incorporated herein.

GAM1300 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1300 target RNA, herein designated GAM TARGET RNA. GAM1300 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1300 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1300 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1300 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1300 RNA, herein designated GAM RNA, to target binding sites on GAM1300 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1300 target RNA into GAM1300 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1300 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1300 target genes. The mRNA of each one of this plurality of GAM1300 target genes comprises one or more target binding sites, each having

a nucleotide sequence which is at least partly complementary to GAM1300 RNA, herein designated GAM RNA, and which when bound by GAM1300 RNA causes inhibition of translation of the GAM1300 target mRNA into a corresponding GAM1300 target protein.

The mechanism of the translational inhibition exerted by GAM1300 RNA, herein designated GAM RNA, on one or more GAM1300 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1300 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1300 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1300 RNA, herein designated GAM RNA, of GAM1300 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1300 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1300 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1300 RNA correlate with, and may be deduced from, the identity of the GAM1300 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1310 6756 GGCGTCTTGC Fig. 8 further provides a conceptual description of another novel bioinformatically
TCTATTGGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
GGCTGGAGTG Messenger 1310 (GAM1310) oligonucleotides modulates expression of respective target genes
CAGTGGTGCG whose function and utility is known in the art.

ATCTCAGCTC GAM1310 is a novel bioinformatically detectable regulatory, non protein coding,
ACTGCAACCC micro RNA (miRNA)-like oligonucleotide. The method by which GAM1310 was detected is

CCGCCTCCCA described with additional reference to Figs. 9-15.

GATTCAAGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ATTCTCCTGC encoded by the human genome.

C GAM1310 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1310
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1310

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1310 precursor RNA is designated SEQ ID:6756, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6756 is located from position 51215356 to position 51215446 relative to chromosome 14 on the `+` strand.

GAM1310 precursor RNA folds onto itself, forming GAM1310 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1310 precursor RNA, designated SEQ ID NO: 6756, and a schematic representation of a predicted secondary folding of GAM1310 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1310 folded precursor RNA yielding a GAM1310 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1310 RNA, hereby incorporated herein.

GAM1310 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1310 target RNA, herein designated GAM TARGET RNA. GAM1310 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1310 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1310 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1310 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1310 RNA, herein designated GAM RNA, to target binding sites on GAM1310 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1310 target RNA into GAM1310 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1310 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1310 target genes. The mRNA of each one of this plurality of GAM1310 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1310 RNA, herein designated GAM RNA, and which when bound by GAM1310 RNA causes inhibition of translation of the GAM1310 target mRNA into a corresponding GAM1310 target protein.

The mechanism of the translational inhibition exerted by GAM1310 RNA, herein designated GAM RNA, on one or more GAM1310 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1310 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1310 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1310 RNA, herein designated GAM RNA, of GAM1310 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1310 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1310 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1310 RNA correlate with, and may be deduced from, the identity of the GAM1310 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1332 6486 GCACCCTGTG Fig. 8 further provides a conceptual description of another novel bioinformatically

AGGTAGGTGC detected oligonucleotides of the present invention, referred to here as Genomic Address

TTTAACTGTG Messenger 1332 (GAM1332) oligonucleotides modulates expression of respective target genes

TGCACCCTGT whose function and utility is known in the art.

GAGGTAGGTG GAM1332 is a novel bioinformatically detectable regulatory, non protein coding,

CTTTAACTGT micro RNA (miRNA)-like oligonucleotide. The method by which GAM1332 was detected is

GTGCACATTG described with additional reference to Figs. 9-15.

TGAGGTAGGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GCTGAAACTG encoded by the human genome.

C GAM1332 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1332 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1332 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1332 precursor RNA is designated SEQ ID:6486, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6486 is located from position 93614973 to position 93615063 relative to chromosome 14 on the `+` strand.

GAM1332 precursor RNA folds onto itself, forming GAM1332 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1332 precursor RNA, designated SEQ ID NO: 6486, and a schematic representation of a predicted secondary folding of GAM1332 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1332 folded precursor RNA yielding a GAM1332 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1332 RNA, hereby incorporated herein.

GAM1332 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1332 target RNA, herein designated GAM TARGET RNA. GAM1332 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1332 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1332 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1332 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1332 RNA, herein designated GAM RNA, to target binding sites on GAM1332 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1332 target RNA into GAM1332 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1332 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1332 target genes. The mRNA of each one of this plurality of GAM1332 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1332 RNA, herein designated GAM RNA, and which when bound by GAM1332 RNA causes inhibition of translation of the GAM1332 target mRNA into a corresponding GAM1332 target protein.

The mechanism of the translational inhibition exerted by GAM1332 RNA, herein designated GAM RNA, on one or more GAM1332 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1332 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1332 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1332 RNA, herein designated GAM RNA, of GAM1332 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1332 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1332 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1332 RNA correlate with, and may be deduced from, the identity of the GAM1332 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1338 6668 GGAGAATGGC Fig. 8 further provides a conceptual description of another novel bioinformatically
ATGAACCCGG detected oligonucleotides of the present invention, referred to here as Genomic Address
GAGGTGGAGC Messenger 1338 (GAM1338) oligonucleotides modulates expression of respective target genes
TTGCAGTGAG whose function and utility is known in the art.

CAGAGATCAC GAM1338 is a novel bioinformatically detectable regulatory, non protein coding,
GCCACTGCAC micro RNA (miRNA)-like oligonucleotide. The method by which GAM1338 was detected is

TCCAGCCTGG described with additional reference to Figs. 9-15.

GCAACAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGACTCC encoded by the human genome.

GAM1338 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1338 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1338 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1338 precursor RNA is designated SEQ ID:6668, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6668 is located from position 62757693 to position 62757780 relative to chromosome 11 on the `+` strand.

GAM1338 precursor RNA folds onto itself, forming GAM1338 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1338 precursor RNA, designated SEQ ID NO: 6668, and a schematic representation of a predicted secondary folding of GAM1338 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1338 folded precursor RNA yielding a GAM1338 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1338 RNA, hereby incorporated herein. Expression of GAM1338 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM1338 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1338 target RNA, herein designated GAM TARGET RNA. GAM1338 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1338 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1338 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1338 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows

three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1338 RNA, herein designated GAM RNA, to target binding sites on GAM1338 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1338 target RNA into GAM1338 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1338 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1338 target genes. The mRNA of each one of this plurality of GAM1338 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1338 RNA, herein designated GAM RNA, and which when bound by GAM1338 RNA causes inhibition of translation of the GAM1338 target mRNA into a corresponding GAM1338 target protein.

The mechanism of the translational inhibition exerted by GAM1338 RNA, herein designated GAM RNA, on one or more GAM1338 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1338 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1338 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1338 RNA, herein designated GAM RNA, of GAM1338 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1338 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1338 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1338 RNA correlate with, and may be deduced from, the identity of the GAM1338 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

AATATGTAGA Messenger 1361 (GAM1361) oligonucleotides modulates expression of respective target genes

TTCTACTACA whose function and utility is known in the art.

ATATTTTAGC GAM1361 is a novel bioinformatically detectable regulatory, non protein coding, TAAAGAAGAA micro RNA (miRNA)-like oligonucleotide. The method by which GAM1361 was detected is

GAAGTAGTAG described with additional reference to Figs. 9-15.

TAGCAGTAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGTCAGTATT encoded by the human genome.

TTTGACCCTG GAM1361 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1361

ACCCAACTCT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1361

G precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1361 precursor RNA is designated SEQ ID:6009, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6009 is located from position 40576956 to position 40577066 relative to chromosome X on the `+` strand.

GAM1361 precursor RNA folds onto itself, forming GAM1361 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1361 precursor RNA, designated SEQ ID NO: 6009, and a schematic representation of a predicted secondary folding of GAM1361 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1361 folded precursor RNA yielding a GAM1361 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1361 RNA, hereby incorporated herein.

GAM1361 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1361 target RNA, herein designated GAM TARGET RNA. GAM1361 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1361 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1361 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1361 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1361 RNA, herein designated GAM RNA, to target binding sites on GAM1361 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1361 target RNA into GAM1361 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1361 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1361 target genes. The mRNA of each one of this plurality of GAM1361 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1361 RNA, herein designated GAM RNA, and which when bound by GAM1361 RNA causes inhibition of translation of the GAM1361 target mRNA into a corresponding GAM1361 target protein.

The mechanism of the translational inhibition exerted by GAM1361 RNA, herein designated GAM RNA, on one or more GAM1361 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1361 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1361 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1361 RNA, herein designated GAM RNA, of GAM1361 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1361 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1361 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1361 RNA correlate with, and may be deduced from, the identity of the GAM1361 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1363 5727 AGAGCTGGTG Fig. 8 further provides a conceptual description of another novel bioinformatically

TGTAGCGGGT detected oligonucleotides of the present invention, referred to here as Genomic Address

ACCTTCTGTC Messenger 1363 (GAM1363) oligonucleotides modulates expression of respective target genes

TGCTGGCACT whose function and utility is known in the art.

AGGTATTTTA GAM1363 is a novel bioinformatically detectable regulatory, non protein coding,

CACATTAAAT micro RNA (miRNA)-like oligonucleotide. The method by which GAM1363 was detected is

CAGCTCGTTC described with additional reference to Figs. 9-15.

TCACATCAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TCT encoded by the human genome.

GAM1363 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1363

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1363

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1363 precursor RNA is designated SEQ ID:5727, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5727 is located from position 54861174 to position 54861256 relative to chromosome 7 on the `+` strand.

GAM1363 precursor RNA folds onto itself, forming GAM1363 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1363 precursor RNA, designated SEQ ID NO: 5727, and a schematic representation of a predicted secondary folding of GAM1363 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1363 folded precursor RNA yielding a GAM1363 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1363 RNA, hereby incorporated herein.

GAM1363 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1363 target RNA, herein designated GAM TARGET RNA. GAM1363 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1363 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1363 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1363 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1363 RNA, herein designated GAM RNA, to target binding sites on GAM1363 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1363 target RNA into GAM1363 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1363 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1363 target genes. The mRNA of each one of this plurality of GAM1363 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1363 RNA, herein designated GAM RNA, and which when bound by GAM1363 RNA causes inhibition of translation of the GAM1363 target mRNA into a corresponding GAM1363 target protein.

The mechanism of the translational inhibition exerted by GAM1363 RNA, herein designated GAM RNA, on one or more GAM1363 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1363 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1363 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1363 RNA, herein designated GAM RNA, of GAM1363 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1363 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1363 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1363 RNA correlate with, and may be deduced from, the identity of the GAM1363 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1372 6523 GCTAGGATTG Fig. 8 further provides a conceptual description of another novel bioinformatically
CACCACTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
CTCCAACCTG Messenger 1372 (GAM1372) oligonucleotides modulates expression of respective target genes
GACAACAGAG whose function and utility is known in the art.

CAAGACCCTG GAM1372 is a novel bioinformatically detectable regulatory, non protein coding,
TCTCTAGGCC micro RNA (miRNA)-like oligonucleotide. The method by which GAM1372 was detected is

AGGTGCAGTG described with additional reference to Figs. 9-15.

GCTCACACCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GTAATCCCAG encoded by the human genome.

C GAM1372 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1372
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1372
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1372 precursor RNA is designated SEQ ID:6523, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6523 is located from position 71938248 to position 71938338 relative to chromosome 7 on the `+` strand.

GAM1372 precursor RNA folds onto itself, forming GAM1372 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1372 precursor RNA, designated SEQ ID NO: 6523, and a schematic representation of a predicted secondary folding of GAM1372 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1372 folded precursor RNA yielding a GAM1372 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the

nucleotide sequence of GAM1372 RNA, hereby incorporated herein.

GAM1372 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1372 target RNA, herein designated GAM TARGET RNA. GAM1372 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1372 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1372 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1372 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1372 RNA, herein designated GAM RNA, to target binding sites on GAM1372 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1372 target RNA into GAM1372 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1372 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1372 target genes. The mRNA of each one of this plurality of GAM1372 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1372 RNA, herein designated GAM RNA, and which when bound by GAM1372 RNA causes inhibition of translation of the GAM1372 target mRNA into a corresponding GAM1372 target protein.

The mechanism of the translational inhibition exerted by GAM1372 RNA, herein designated GAM RNA, on one or more GAM1372 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1372 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1372 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1372 RNA, herein designated GAM RNA, of GAM1372 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1372 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1372 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1372 RNA correlate with, and may be deduced from, the identity of the GAM1372 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1423 6359 GAGCAAGGAC Fig. 8 further provides a conceptual description of another novel bioinformatically

CTTCCCAGTC Messenger 1423 (GAM1423) oligonucleotides modulates expression of respective target genes
CTCTCTCCAT whose function and utility is known in the art.

TTGCAGATCA GAM1423 is a novel bioinformatically detectable regulatory, non protein coding,
GCAAGCTTCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM1423 was detected is

GTCAGCAAGG described with additional reference to Figs. 9-15.

AGGGGTGGAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AATGAAACTG encoded by the human genome.

GGTTCAGCTT GAM1423 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1423
GATTTGTTT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1423
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1423 precursor RNA is designated SEQ ID:6359, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6359 is located from position 97689214 to position 97689322 relative to chromosome 9 on the `+` strand.

GAM1423 precursor RNA folds onto itself, forming GAM1423 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1423 precursor RNA, designated SEQ ID NO: 6359, and a schematic representation of a predicted secondary folding of GAM1423 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1423 folded precursor RNA

yielding a GAM1423 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1423 RNA, hereby incorporated herein.

GAM1423 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1423 target RNA, herein designated GAM TARGET RNA. GAM1423 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1423 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1423 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1423 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1423 RNA, herein designated GAM RNA, to target binding sites on GAM1423 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1423 target RNA into GAM1423 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1423 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1423 target genes. The mRNA of each one of this plurality of GAM1423 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1423 RNA, herein designated GAM RNA, and which when bound by GAM1423 RNA causes inhibition of translation of the GAM1423 target mRNA into a corresponding GAM1423 target protein.

The mechanism of the translational inhibition exerted by GAM1423 RNA, herein designated GAM RNA, on one or more GAM1423 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1423 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1423 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1423 RNA, herein designated GAM RNA, of GAM1423 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1423 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1423 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1423 RNA correlate with, and may be deduced from, the identity of the GAM1423 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1431 6316 GAGAACTGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

ATGGAGGAGA detected oligonucleotides of the present invention, referred to here as Genomic Address

ATTAGAGGAT Messenger 1431 (GAM1431) oligonucleotides modulates expression of respective target genes

GGTGTGGTGT whose function and utility is known in the art.

TTCCCAAGAC GAM1431 is a novel bioinformatically detectable regulatory, non protein coding,

ATCCCCTGAT micro RNA (miRNA)-like oligonucleotide. The method by which GAM1431 was detected is

CTTGCTATCC described with additional reference to Figs. 9-15.

CAGCATCTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM1431 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1431

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1431

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1431 precursor RNA is designated SEQ ID:6316, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6316 is located from position 62113797 to position 62113875 relative to chromosome 14 on the `-` strand.

GAM1431 precursor RNA folds onto itself, forming GAM1431 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1431 precursor RNA, designated SEQ ID NO: 6316, and a

schematic representation of a predicted secondary folding of GAM1431 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1431 folded precursor RNA yielding a GAM1431 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1431 RNA, hereby incorporated herein.

GAM1431 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1431 target RNA, herein designated GAM TARGET RNA. GAM1431 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1431 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1431 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1431 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1431 RNA, herein designated GAM RNA, to target binding sites on GAM1431 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1431 target RNA into GAM1431 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1431 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1431 target genes. The mRNA of each one of this plurality of GAM1431 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1431 RNA, herein designated GAM RNA, and which when bound by GAM1431 RNA causes inhibition of translation of the GAM1431 target mRNA into a corresponding GAM1431 target protein.

The mechanism of the translational inhibition exerted by GAM1431 RNA, herein designated GAM RNA, on one or more GAM1431 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1431 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1431 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1431 RNA, herein designated GAM RNA, of GAM1431 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1431 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1431 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1431 RNA correlate with, and may be deduced from, the identity of the GAM1431 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1440 6286 GAACACAAAG Fig. 8 further provides a conceptual description of another novel bioinformatically
AGGTGTAGAA detected oligonucleotides of the present invention, referred to here as Genomic Address
TCTGGGTTGG Messenger 1440 (GAM1440) oligonucleotides modulates expression of respective target genes
TCCTTCAAGG whose function and utility is known in the art.

CAGCTCATTG GAM1440 is a novel bioinformatically detectable regulatory, non protein coding,
CAGCTACTGG micro RNA (miRNA)-like oligonucleotide. The method by which GAM1440 was detected is

CCTCCAGTGA described with additional reference to Figs. 9-15.

AACAGGTCTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTTGAGCTAT encoded by the human genome.

TTGTTC GAM1440 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1440
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1440
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1440 precursor RNA is designated SEQ ID:6286, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6286 is located from position 45420363 to position 45420458 relative to chromosome 11 on the `-` strand.

GAM1440 precursor RNA folds onto itself, forming GAM1440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1440 precursor RNA, designated SEQ ID NO: 6286, and a schematic representation of a predicted secondary folding of GAM1440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1440 folded precursor RNA yielding a GAM1440 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1440 RNA, hereby incorporated herein.

GAM1440 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1440 target RNA, herein designated GAM TARGET RNA. GAM1440 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1440 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1440 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1440 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1440 RNA, herein designated GAM RNA, to target binding sites on GAM1440 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1440 target RNA into GAM1440 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1440 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1440 target genes. The mRNA of each one of this plurality of GAM1440 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1440 RNA, herein designated GAM RNA, and which when bound by GAM1440 RNA causes inhibition of translation of the GAM1440 target mRNA into a corresponding GAM1440 target protein.

The mechanism of the translational inhibition exerted by GAM1440 RNA, herein

designated GAM RNA, on one or more GAM1440 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1440 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1440 RNA, herein designated GAM RNA, of GAM1440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1440 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1440 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1440 RNA correlate with, and may be deduced from, the identity of the GAM1440 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1443 6192 CTGAAGGGTG Fig. 8 further provides a conceptual description of another novel bioinformatically
GAGAGGGCCT detected oligonucleotides of the present invention, referred to here as Genomic Address
CTCATGCAGG Messenger 1443 (GAM1443) oligonucleotides modulates expression of respective target genes
CATGTGTGAG whose function and utility is known in the art.

CAGCTGCAGG GAM1443 is a novel bioinformatically detectable regulatory, non protein coding,
TGTGTGAGCA micro RNA (miRNA)-like oligonucleotide. The method by which GAM1443 was detected is

AATGTGCATC described with additional reference to Figs. 9-15.

ACTGGGGAAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGGTGTCTGT encoded by the human genome.

GGATGAGGGA GAM1443 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1443
GGAAGTGAGG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1443
GTGAGG precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1443 precursor RNA is designated SEQ ID:6192, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6192 is located from position 79169031 to position 79169146 relative to chromosome 10

on the `+` strand.

GAM1443 precursor RNA folds onto itself, forming GAM1443 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1443 precursor RNA, designated SEQ ID NO: 6192, and a schematic representation of a predicted secondary folding of GAM1443 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1443 folded precursor RNA yielding a GAM1443 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1443 RNA, hereby incorporated herein.

GAM1443 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1443 target RNA, herein designated GAM TARGET RNA. GAM1443 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1443 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1443 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1443 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1443 RNA, herein designated GAM RNA, to target binding sites on GAM1443 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1443 target RNA into GAM1443 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1443 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1443 target genes. The mRNA of each one of this plurality of GAM1443 target genes comprises one or more target binding sites, each having

a nucleotide sequence which is at least partly complementary to GAM1443 RNA, herein designated GAM RNA, and which when bound by GAM1443 RNA causes inhibition of translation of the GAM1443 target mRNA into a corresponding GAM1443 target protein.

The mechanism of the translational inhibition exerted by GAM1443 RNA, herein designated GAM RNA, on one or more GAM1443 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1443 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1443 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1443 RNA, herein designated GAM RNA, of GAM1443 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1443 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1443 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1443 RNA correlate with, and may be deduced from, the identity of the GAM1443 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1447 6873 GTCCACACTG Fig. 8 further provides a conceptual description of another novel bioinformatically

ACCTTCTGTG detected oligonucleotides of the present invention, referred to here as Genomic Address

TCATGGCATA Messenger 1447 (GAM1447) oligonucleotides modulates expression of respective target genes

TGCCCATGTC whose function and utility is known in the art.

AGGCAGTGCT GAM1447 is a novel bioinformatically detectable regulatory, non protein coding,

GTGCTAAAGG micro RNA (miRNA)-like oligonucleotide. The method by which GAM1447 was detected is

AAGGATTACA described with additional reference to Figs. 9-15.

TGGAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM1447 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1447

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1447

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1447 precursor RNA is designated SEQ ID:6873, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6873 is located from position 84120401 to position 84120475 relative to chromosome X on the `+` strand.

GAM1447 precursor RNA folds onto itself, forming GAM1447 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1447 precursor RNA, designated SEQ ID NO: 6873, and a schematic representation of a predicted secondary folding of GAM1447 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1447 folded precursor RNA yielding a GAM1447 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1447 RNA, hereby incorporated herein.

GAM1447 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1447 target RNA, herein designated GAM TARGET RNA. GAM1447 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1447 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1447 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1447 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1447 RNA, herein designated GAM RNA, to target binding sites on GAM1447 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1447 target RNA into GAM1447 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1447 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1447 target genes. The mRNA of each one of this plurality of GAM1447 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1447 RNA, herein designated GAM RNA, and which when bound by GAM1447 RNA causes inhibition of translation of the GAM1447 target mRNA into a corresponding GAM1447 target protein.

The mechanism of the translational inhibition exerted by GAM1447 RNA, herein designated GAM RNA, on one or more GAM1447 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1447 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1447 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1447 RNA, herein designated GAM RNA, of GAM1447 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1447 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1447 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1447 RNA correlate with, and may be deduced from, the identity of the GAM1447 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1456 6957 TAAGATGAGT Fig. 8 further provides a conceptual description of another novel bioinformatically

TGATATTCAA detected oligonucleotides of the present invention, referred to here as Genomic Address

ATATCCAGTT Messenger 1456 (GAM1456) oligonucleotides modulates expression of respective target genes

AGTAATGAAA whose function and utility is known in the art.

ACAATACAAT GAM1456 is a novel bioinformatically detectable regulatory, non protein coding,

ACTGAGAGAA micro RNA (miRNA)-like oligonucleotide. The method by which GAM1456 was detected is

AAAGCTTGTC described with additional reference to Figs. 9-15.

TTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM1456 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1456 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1456 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1456 precursor RNA is designated SEQ ID:6957, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6957 is located from position 27561775 to position 27561847 relative to chromosome 10 on the `+` strand.

GAM1456 precursor RNA folds onto itself, forming GAM1456 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1456 precursor RNA, designated SEQ ID NO: 6957, and a schematic representation of a predicted secondary folding of GAM1456 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1456 folded precursor RNA yielding a GAM1456 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1456 RNA, hereby incorporated herein.

GAM1456 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1456 target RNA, herein designated GAM TARGET RNA. GAM1456 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1456 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1456 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1456 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1456 RNA, herein designated GAM RNA, to target binding sites on GAM1456 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1456 target RNA into GAM1456 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1456 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1456 target genes. The mRNA of each one of this plurality of GAM1456 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1456 RNA, herein designated GAM RNA, and which when bound by GAM1456 RNA causes inhibition of translation of the GAM1456 target mRNA into a corresponding GAM1456 target protein.

The mechanism of the translational inhibition exerted by GAM1456 RNA, herein designated GAM RNA, on one or more GAM1456 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1456 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1456 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1456 RNA, herein designated GAM RNA, of GAM1456 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1456 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1456 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1456 RNA correlate with, and may be deduced from, the identity of the GAM1456 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TTATGCAGAT detected oligonucleotides of the present invention, referred to here as Genomic Address
GAAGAAGATG Messenger 1461 (GAM1461) oligonucleotides modulates expression of respective target genes
AAGCCCGAGA whose function and utility is known in the art.

GGTTATGAAA GAM1461 is a novel bioinformatically detectable regulatory, non protein coding,
CAGACCCAAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM1461 was detected is

TGGGCTCGCT described with additional reference to Figs. 9-15.

CTTCAGTCTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGCATAAGGA encoded by the human genome.

ATCCG GAM1461 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1461 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1461 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1461 precursor RNA is designated SEQ ID:7268, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7268 is located from position 11377024 to position 11377118 relative to chromosome 16 on the `+` strand.

GAM1461 precursor RNA folds onto itself, forming GAM1461 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1461 precursor RNA, designated SEQ ID NO: 7268, and a schematic representation of a predicted secondary folding of GAM1461 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1461 folded precursor RNA yielding a GAM1461 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1461 RNA, hereby incorporated herein.

GAM1461 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1461 target RNA, herein designated GAM TARGET RNA. GAM1461 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1461 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1461 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1461 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1461 RNA, herein designated GAM RNA, to target binding sites on GAM1461 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1461 target RNA into GAM1461 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1461 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1461 target genes. The mRNA of each one of this plurality of GAM1461 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1461 RNA, herein designated GAM RNA, and which when bound by GAM1461 RNA causes inhibition of translation of the GAM1461 target mRNA into a corresponding GAM1461 target protein.

The mechanism of the translational inhibition exerted by GAM1461 RNA, herein designated GAM RNA, on one or more GAM1461 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1461 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1461 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1461 RNA, herein designated GAM RNA, of GAM1461 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1461 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1461 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1461 RNA correlate with, and may be deduced from, the identity of the GAM1461 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1469 6871 GTCAGGACTG Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGGCTAAGG detected oligonucleotides of the present invention, referred to here as Genomic Address
GAATGTCTGC Messenger 1469 (GAM1469) oligonucleotides modulates expression of respective target genes

TTGGACTGAT whose function and utility is known in the art.

CATTGAACAA GAM1469 is a novel bioinformatically detectable regulatory, non protein coding,
TCTTTCCAAC micro RNA (miRNA)-like oligonucleotide. The method by which GAM1469 was detected is

TAAAAGCTTC described with additional reference to Figs. 9-15.

TATGATTCTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TAAGTAGCAA encoded by the human genome.

TCAGCACCGA GAM1469 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1469
CAGTTATGAT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1469

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1469 precursor RNA is designated SEQ ID:6871, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6871 is located from position 51978690 to position 51978799 relative to chromosome 14 on the `-` strand.

GAM1469 precursor RNA folds onto itself, forming GAM1469 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1469 precursor RNA, designated SEQ ID NO: 6871, and a schematic representation of a predicted secondary folding of GAM1469 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1469 folded precursor RNA yielding a GAM1469 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM1469 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1469 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM1469 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1469 target RNA, herein designated GAM TARGET RNA. GAM1469 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1469 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM1469 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1469 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1469 RNA, herein designated GAM RNA, to target binding sites on GAM1469 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1469 target RNA into GAM1469 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1469 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1469 target genes. The mRNA of each one of this plurality of GAM1469 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1469 RNA, herein designated GAM RNA, and which when bound by GAM1469 RNA causes inhibition of translation of the GAM1469 target mRNA into a corresponding GAM1469 target protein.

The mechanism of the translational inhibition exerted by GAM1469 RNA, herein designated GAM RNA, on one or more GAM1469 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1469 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1469 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1469 RNA, herein designated GAM RNA, of GAM1469 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1469 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1469 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1469 RNA correlate with, and may be deduced from, the identity of the GAM1469 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1479 6776 GGGAAGGCAG Fig. 8 further provides a conceptual description of another novel bioinformatically
TAGGTTGTAT detected oligonucleotides of the present invention, referred to here as Genomic Address
AGTTATCTTC Messenger 1479 (GAM1479) oligonucleotides modulates expression of respective target genes
CGAGGGGCAA whose function and utility is known in the art.

CATCACTGCC GAM1479 is a novel bioinformatically detectable regulatory, non protein coding,
CTGAAACCAC micro RNA (miRNA)-like oligonucleotide. The method by which GAM1479 was detected is

ACAACCTACT described with additional reference to Figs. 9-15.

ACCTCACC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM1479 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1479

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1479
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1479 precursor RNA is designated SEQ ID:6776, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6776 is located from position 44721810 to position 44721887 relative to chromosome 22 on the `-` strand.

GAM1479 precursor RNA folds onto itself, forming GAM1479 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1479 precursor RNA, designated SEQ ID NO: 6776, and a schematic representation of a predicted secondary folding of GAM1479 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1479 folded precursor RNA yielding a GAM1479 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1479 RNA, hereby incorporated herein. Expression of GAM1479 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM1479 target gene, herein designated GAM TARGET GENE, encodes a corresponding

messenger RNA, GAM1479 target RNA, herein designated GAM TARGET RNA. GAM1479 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1479 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1479 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1479 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1479 RNA, herein designated GAM RNA, to target binding sites on GAM1479 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1479 target RNA into GAM1479 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1479 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1479 target genes. The mRNA of each one of this plurality of GAM1479 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1479 RNA, herein designated GAM RNA, and which when bound by GAM1479 RNA causes inhibition of translation of the GAM1479 target mRNA into a corresponding GAM1479 target protein.

The mechanism of the translational inhibition exerted by GAM1479 RNA, herein designated GAM RNA, on one or more GAM1479 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1479 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1479 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1479 RNA, herein designated GAM RNA, of GAM1479 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1479 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target

binding sites to GAM1479 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1479 RNA correlate with, and may be deduced from, the identity of the GAM1479 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1484 7257 TGGTTGCAAG Fig. 8 further provides a conceptual description of another novel bioinformatically
GCAGGAAATA detected oligonucleotides of the present invention, referred to here as Genomic Address
TTGGTGAAAT Messenger 1484 (GAM1484) oligonucleotides modulates expression of respective target genes
GCTAGCAAAG whose function and utility is known in the art.

TCACAATTTC GAM1484 is a novel bioinformatically detectable regulatory, non protein coding,
TACTCTGAAC micro RNA (miRNA)-like oligonucleotide. The method by which GAM1484 was detected is

ATGATTTGCA described with additional reference to Figs. 9-15.

GTGTTCATCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GTATTTTTCT encoded by the human genome.

GAACCCTGCT GAM1484 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1484
TTACCA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1484
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1484 precursor RNA is designated SEQ ID:7257, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7257 is located from position 63061687 to position 63061792 relative to chromosome 10 on the `-` strand.

GAM1484 precursor RNA folds onto itself, forming GAM1484 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1484 precursor RNA, designated SEQ ID NO: 7257, and a schematic representation of a predicted secondary folding of GAM1484 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1484 folded precursor RNA yielding a GAM1484 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an

enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM1484 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1484 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM1484 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1484 target RNA, herein designated GAM TARGET RNA. GAM1484 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1484 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1484 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1484 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1484 RNA, herein designated GAM RNA, to target binding sites on GAM1484 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1484 target RNA into GAM1484 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1484 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1484 target genes. The mRNA of each one of this plurality of GAM1484 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1484 RNA, herein designated GAM RNA, and which when bound by GAM1484 RNA causes inhibition of translation of the GAM1484 target mRNA into a corresponding GAM1484 target protein.

The mechanism of the translational inhibition exerted by GAM1484 RNA, herein designated GAM RNA, on one or more GAM1484 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1484 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1484 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1484 RNA, herein designated GAM RNA, of GAM1484 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1484 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1484 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1484 RNA correlate with, and may be deduced from, the identity of the GAM1484 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1490 6362 GAGCTCCCAC GGCTTTTCTA GAAATTGGCA CACAAACTCC AAAGCGTGTG TGGAAATGCA GATGACCTGG GAGACCCAAA ACAACCTC

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 1490 (GAM1490) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM1490 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM1490 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM1490 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1490 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1490 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1490 precursor RNA is designated SEQ ID:6362, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6362 is located from position 132157864 to position 132157951 relative to chromosome 12 on the `+` strand.

GAM1490 precursor RNA folds onto itself, forming GAM1490 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1490 precursor RNA, designated SEQ ID NO: 6362, and a schematic representation of a predicted secondary folding of GAM1490 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1490 folded precursor RNA yielding a GAM1490 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1490 RNA, hereby incorporated herein.

GAM1490 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1490 target RNA, herein designated GAM TARGET RNA. GAM1490 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1490 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1490 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1490 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1490 RNA, herein designated GAM RNA, to target binding sites on GAM1490 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1490 target RNA into GAM1490 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1490 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1490 target genes. The mRNA of each one of this plurality of GAM1490 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1490 RNA, herein designated GAM RNA, and which when bound by GAM1490 RNA causes inhibition of translation of the GAM1490 target mRNA into a corresponding GAM1490 target protein.

The mechanism of the translational inhibition exerted by GAM1490 RNA, herein designated GAM RNA, on one or more GAM1490 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1490 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1490 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1490 RNA, herein designated GAM RNA, of GAM1490 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1490 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1490 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1490 RNA correlate with, and may be deduced from, the identity of the GAM1490 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1500 6505 GCCCGGTGCT Fig. 8 further provides a conceptual description of another novel bioinformatically

CGGTTTGTAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GCAGTGTCAT Messenger 1500 (GAM1500) oligonucleotides modulates expression of respective target genes

TAGCTGATTG whose function and utility is known in the art.

TACTGTGGTG GAM1500 is a novel bioinformatically detectable regulatory, non protein coding,

GTTACAATCA micro RNA (miRNA)-like oligonucleotide. The method by which GAM1500 was detected is

CTAACTCCAC described with additional reference to Figs. 9-15.

TGCCATCAAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACAAGGCACA encoded by the human genome.

GC GAM1500 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1500

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1500

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1500 precursor RNA is designated SEQ ID:6505, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6505 is located from position 111417608 to position 111417699 relative to chromosome 11 on the `+` strand.

GAM1500 precursor RNA folds onto itself, forming GAM1500 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1500 precursor RNA, designated SEQ ID NO: 6505, and a schematic representation of a predicted secondary folding of GAM1500 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1500 folded precursor RNA yielding a GAM1500 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1500 RNA, hereby incorporated herein.

GAM1500 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1500 target RNA, herein designated GAM TARGET RNA. GAM1500 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1500 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1500 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1500 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1500 RNA, herein designated GAM RNA, to target binding sites on GAM1500 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1500 target RNA into GAM1500 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1500 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1500 target genes. The mRNA of each one of this plurality of GAM1500 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1500 RNA, herein designated GAM RNA, and which when bound by GAM1500 RNA causes inhibition of translation of the GAM1500 target mRNA into a corresponding GAM1500 target protein.

The mechanism of the translational inhibition exerted by GAM1500 RNA, herein designated GAM RNA, on one or more GAM1500 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1500 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1500 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1500 RNA, herein designated GAM RNA, of GAM1500 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1500 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1500 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1500 RNA correlate with, and may be deduced from, the identity of the GAM1500 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1502 6035 CATATATGTC Fig. 8 further provides a conceptual description of another novel bioinformatically

ACAGTTTGGC detected oligonucleotides of the present invention, referred to here as Genomic Address

ACTGAATCAT Messenger 1523 (GAM1523) oligonucleotides modulates expression of respective target genes

ATACAATCTC whose function and utility is known in the art.

GTAGTTTGGA GAM1523 is a novel bioinformatically detectable regulatory, non protein coding,

TGGCTGTGTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM1523 was detected is

TGACTGCAGA described with additional reference to Figs. 9-15.

CTGCTAGACA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GCAGGG encoded by the human genome.

GAM1523 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1523

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1523

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1523 precursor RNA is designated SEQ ID:6065, and is

provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6065 is located from position 102859224 to position 102859309 relative to chromosome 10 on the `-` strand.

GAM1523 precursor RNA folds onto itself, forming GAM1523 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1523 precursor RNA, designated SEQ ID NO: 6065, and a schematic representation of a predicted secondary folding of GAM1523 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1523 folded precursor RNA yielding a GAM1523 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1523 RNA, hereby incorporated herein.

GAM1523 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1523 target RNA, herein designated GAM TARGET RNA. GAM1523 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1523 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1523 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1523 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1523 RNA, herein designated GAM RNA, to target binding sites on GAM1523 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1523 target RNA into GAM1523 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1523 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM1523 target genes. The mRNA of each one of this plurality of GAM1523 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1523 RNA, herein designated GAM RNA, and which when bound by GAM1523 RNA causes inhibition of translation of the GAM1523 target mRNA into a corresponding GAM1523 target protein.

The mechanism of the translational inhibition exerted by GAM1523 RNA, herein designated GAM RNA, on one or more GAM1523 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1523 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1523 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1523 RNA, herein designated GAM RNA, of GAM1523 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1523 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1523 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1523 RNA correlate with, and may be deduced from, the identity of the GAM1523 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1543 6677 GGAGAATTGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAACCCAA detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGTGGAGG Messenger 1543 (GAM1543) oligonucleotides modulates expression of respective target genes

TTGCAGTGAG whose function and utility is known in the art.

CCACGATTGT GAM1543 is a novel bioinformatically detectable regulatory, non protein coding,

GCCATTGCAC micro RNA (miRNA)-like oligonucleotide. The method by which GAM1543 was detected is

TCCAGCCTGG described with additional reference to Figs. 9-15.

GTGACAGAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGACTCC encoded by the human genome.

GAM1543 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1543

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1543 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1543 precursor RNA is designated SEQ ID:6677, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6677 is located from position 28383578 to position 28383665 relative to chromosome 16 on the `-` strand.

GAM1543 precursor RNA folds onto itself, forming GAM1543 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1543 precursor RNA, designated SEQ ID NO: 6677, and a schematic representation of a predicted secondary folding of GAM1543 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1543 folded precursor RNA yielding a GAM1543 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1543 RNA, hereby incorporated herein.

GAM1543 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1543 target RNA, herein designated GAM TARGET RNA. GAM1543 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1543 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1543 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1543 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1543 RNA, herein designated GAM RNA, to target binding sites on GAM1543 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1543 target RNA

into GAM1543 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1543 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1543 target genes. The mRNA of each one of this plurality of GAM1543 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1543 RNA, herein designated GAM RNA, and which when bound by GAM1543 RNA causes inhibition of translation of the GAM1543 target mRNA into a corresponding GAM1543 target protein.

The mechanism of the translational inhibition exerted by GAM1543 RNA, herein designated GAM RNA, on one or more GAM1543 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1543 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1543 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1543 RNA, herein designated GAM RNA, of GAM1543 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1543 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1543 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1543 RNA correlate with, and may be deduced from, the identity of the GAM1543 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1550 7284 TTACTGAGTA Fig. 8 further provides a conceptual description of another novel bioinformatically

TTCACCAGGT detected oligonucleotides of the present invention, referred to here as Genomic Address

GCTGGGTGGA Messenger 1550 (GAM1550) oligonucleotides modulates expression of respective target genes

GAAAGAAGAC whose function and utility is known in the art.

TTAAAGATTC GAM1550 is a novel bioinformatically detectable regulatory, non protein coding,

CCTAGACATC micro RNA (miRNA)-like oligonucleotide. The method by which GAM1550 was detected is

TCCTCTCCCC described with additional reference to Figs. 9-15.

TAGACTCAGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACCATGGCAC encoded by the human genome.

TTATTTTCTA GAM1550 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1550 G precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1550 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1550 precursor RNA is designated SEQ ID:7284, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7284 is located from position 35798284 to position 35798384 relative to chromosome 9 on the `+` strand.

GAM1550 precursor RNA folds onto itself, forming GAM1550 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1550 precursor RNA, designated SEQ ID NO: 7284, and a schematic representation of a predicted secondary folding of GAM1550 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1550 folded precursor RNA yielding a GAM1550 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1550 RNA, hereby incorporated herein.

GAM1550 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1550 target RNA, herein designated GAM TARGET RNA. GAM1550 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1550 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1550 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1550 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1550 RNA, herein designated GAM RNA, to target binding sites on GAM1550 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1550 target RNA into GAM1550 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1550 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1550 target genes. The mRNA of each one of this plurality of GAM1550 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1550 RNA, herein designated GAM RNA, and which when bound by GAM1550 RNA causes inhibition of translation of the GAM1550 target mRNA into a corresponding GAM1550 target protein.

The mechanism of the translational inhibition exerted by GAM1550 RNA, herein designated GAM RNA, on one or more GAM1550 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1550 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1550 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1550 RNA, herein designated GAM RNA, of GAM1550 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1550 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1550 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1550 RNA correlate with, and may be deduced from, the identity of the GAM1550 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

AATCACACAA Messenger 1602 (GAM1602) oligonucleotides modulates expression of respective target genes

TGGGTGCATC whose function and utility is known in the art.

ACCAGTGCGG GAM1602 is a novel bioinformatically detectable regulatory, non protein coding,

ACACCTAGGC micro RNA (miRNA)-like oligonucleotide. The method by which GAM1602 was detected is

GTACAGGGAA described with additional reference to Figs. 9-15.

CCATGGCTTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGGAGTGTAA encoded by the human genome.

AGAAGGATGT GAM1602 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1602

TACCCCAGGA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1602

TGCAGTTCAG precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar ACAATTTTAT to the nucleotide sequence of GAM1602 precursor RNA is designated SEQ ID:6292, and is

C provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6292 is located from position 33016836 to position 33016966 relative to chromosome 19 on the `-` strand.

GAM1602 precursor RNA folds onto itself, forming GAM1602 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1602 precursor RNA, designated SEQ ID NO: 6292, and a schematic representation of a predicted secondary folding of GAM1602 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1602 folded precursor RNA yielding a GAM1602 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1602 RNA, hereby incorporated herein.

GAM1602 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1602 target RNA, herein designated GAM TARGET RNA. GAM1602 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1602 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1602 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1602 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING

SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1602 RNA, herein designated GAM RNA, to target binding sites on GAM1602 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1602 target RNA into GAM1602 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1602 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1602 target genes. The mRNA of each one of this plurality of GAM1602 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1602 RNA, herein designated GAM RNA, and which when bound by GAM1602 RNA causes inhibition of translation of the GAM1602 target mRNA into a corresponding GAM1602 target protein.

The mechanism of the translational inhibition exerted by GAM1602 RNA, herein designated GAM RNA, on one or more GAM1602 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1602 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1602 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1602 RNA, herein designated GAM RNA, of GAM1602 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1602 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1602 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1602 RNA correlate with, and may be deduced from, the identity of the GAM1602 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1607 6972 TAGGCTGTAT Fig. 8 further provides a conceptual description of another novel bioinformatically

GCTGTTAATG detected oligonucleotides of the present invention, referred to here as Genomic Address

CTAATCGTGA Messenger 1607 (GAM1607) oligonucleotides modulates expression of respective target genes

TAGGGGTTTT whose function and utility is known in the art.

TGCCTCCAAC GAM1607 is a novel bioinformatically detectable regulatory, non protein coding,
TGACTCCTAC micro RNA (miRNA)-like oligonucleotide. The method by which GAM1607 was detected is

ATATTAGCAT described with additional reference to Figs. 9-15.

TAACAGTGTA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGATGCCTG encoded by the human genome.

GAM1607 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1607

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1607

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1607 precursor RNA is designated SEQ ID:6972, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6972 is located from position 25868151 to position 25868239 relative to chromosome 21 on the `+` strand.

GAM1607 precursor RNA folds onto itself, forming GAM1607 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1607 precursor RNA, designated SEQ ID NO: 6972, and a schematic representation of a predicted secondary folding of GAM1607 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1607 folded precursor RNA yielding a GAM1607 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1607 RNA, hereby incorporated herein.

GAM1607 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1607 target RNA, herein designated GAM TARGET RNA. GAM1607 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1607 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1607 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1607 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1607 RNA, herein designated GAM RNA, to target binding sites on GAM1607 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1607 target RNA into GAM1607 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1607 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1607 target genes. The mRNA of each one of this plurality of GAM1607 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1607 RNA, herein designated GAM RNA, and which when bound by GAM1607 RNA causes inhibition of translation of the GAM1607 target mRNA into a corresponding GAM1607 target protein.

The mechanism of the translational inhibition exerted by GAM1607 RNA, herein designated GAM RNA, on one or more GAM1607 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1607 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1607 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1607 RNA, herein designated GAM RNA, of GAM1607 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1607 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1607 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1607 RNA correlate with, and may be deduced from, the identity of the GAM1607 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1617 5952 ATAGACAGGT Fig. 8 further provides a conceptual description of another novel bioinformatically

CTCACTCTGT detected oligonucleotides of the present invention, referred to here as Genomic Address

TGCCCAGGCT Messenger 1617 (GAM1617) oligonucleotides modulates expression of respective target genes

GGAGTGCAGT whose function and utility is known in the art.

GGTGTGACTG GAM1617 is a novel bioinformatically detectable regulatory, non protein coding,

TAGCTCACTA micro RNA (miRNA)-like oligonucleotide. The method by which GAM1617 was detected is

TAGCCACCAA described with additional reference to Figs. 9-15.

GTCCTGGGCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAAGCGATCC encoded by the human genome.

TCCTGTCTAT GAM1617 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1617

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1617

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1617 precursor RNA is designated SEQ ID:5952, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5952 is located from position 48119610 to position 48119709 relative to chromosome 16 on the `+` strand.

GAM1617 precursor RNA folds onto itself, forming GAM1617 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1617 precursor RNA, designated SEQ ID NO: 5952, and a schematic representation of a predicted secondary folding of GAM1617 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1617 folded precursor RNA yielding a GAM1617 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1617 RNA, hereby incorporated herein.

GAM1617 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1617 target RNA, herein designated GAM TARGET RNA. GAM1617 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated

region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1617 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1617 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1617 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1617 RNA, herein designated GAM RNA, to target binding sites on GAM1617 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1617 target RNA into GAM1617 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1617 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1617 target genes. The mRNA of each one of this plurality of GAM1617 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1617 RNA, herein designated GAM RNA, and which when bound by GAM1617 RNA causes inhibition of translation of the GAM1617 target mRNA into a corresponding GAM1617 target protein.

The mechanism of the translational inhibition exerted by GAM1617 RNA, herein designated GAM RNA, on one or more GAM1617 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1617 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1617 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1617 RNA, herein designated GAM RNA, of GAM1617 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1617 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1617 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1617 RNA correlate with, and may be deduced from, the identity of the GAM1617 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1650 7253 TGGTGGCTTG Fig. 8 further provides a conceptual description of another novel bioinformatically

GTTTGTGTAC detected oligonucleotides of the present invention, referred to here as Genomic Address

CTATTTTTCT Messenger 1650 (GAM1650) oligonucleotides modulates expression of respective target genes

GCATTTGTAT whose function and utility is known in the art.

TGGAAAAGGT GAM1650 is a novel bioinformatically detectable regulatory, non protein coding,

TTCTTTTAAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM1650 was detected is

ACATTTTCCA described with additional reference to Figs. 9-15.

AAAGTGGAGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGAATATGTG encoded by the human genome.

TGTTCAGGAA GAM1650 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1650

GGGCTTTCA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1650

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1650 precursor RNA is designated SEQ ID:7253, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7253 is located from position 108489391 to position 108489499 relative to chromosome X on the `+` strand.

GAM1650 precursor RNA folds onto itself, forming GAM1650 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1650 precursor RNA, designated SEQ ID NO: 7253, and a schematic representation of a predicted secondary folding of GAM1650 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1650 folded precursor RNA yielding a GAM1650 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM1650 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1650 RNA and an

alternative nucleotide sequence thereof, hereby incorporated herein.

GAM1650 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1650 target RNA, herein designated GAM TARGET RNA. GAM1650 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1650 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1650 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1650 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1650 RNA, herein designated GAM RNA, to target binding sites on GAM1650 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1650 target RNA into GAM1650 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1650 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1650 target genes. The mRNA of each one of this plurality of GAM1650 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1650 RNA, herein designated GAM RNA, and which when bound by GAM1650 RNA causes inhibition of translation of the GAM1650 target mRNA into a corresponding GAM1650 target protein.

The mechanism of the translational inhibition exerted by GAM1650 RNA, herein designated GAM RNA, on one or more GAM1650 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1650 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1650 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1650 RNA, herein designated GAM RNA, of GAM1650 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1650 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1650 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1650 RNA correlate with, and may be deduced from, the identity of the GAM1650 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1653 6846 GGTGGAGCAG Fig. 8 further provides a conceptual description of another novel bioinformatically
AAAGGCAGGA detected oligonucleotides of the present invention, referred to here as Genomic Address
GTCCTGCTCC Messenger 1653 (GAM1653) oligonucleotides modulates expression of respective target genes
CTGGCACCAT whose function and utility is known in the art.

CATGGAGCAT GAM1653 is a novel bioinformatically detectable regulatory, non protein coding,
GCCCAGCCCA micro RNA (miRNA)-like oligonucleotide. The method by which GAM1653 was detected is

GATCTGCCCC described with additional reference to Figs. 9-15.

CC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM1653 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1653

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1653
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1653 precursor RNA is designated SEQ ID:6846, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6846 is located from position 38591310 to position 38591381 relative to chromosome 17 on the `+` strand.

GAM1653 precursor RNA folds onto itself, forming GAM1653 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1653 precursor RNA, designated SEQ ID NO: 6846, and a schematic representation of a predicted secondary folding of GAM1653 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1653 folded precursor RNA

yielding a GAM1653 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1653 RNA, hereby incorporated herein.

GAM1653 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1653 target RNA, herein designated GAM TARGET RNA. GAM1653 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1653 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1653 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1653 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1653 RNA, herein designated GAM RNA, to target binding sites on GAM1653 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1653 target RNA into GAM1653 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1653 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1653 target genes. The mRNA of each one of this plurality of GAM1653 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1653 RNA, herein designated GAM RNA, and which when bound by GAM1653 RNA causes inhibition of translation of the GAM1653 target mRNA into a corresponding GAM1653 target protein.

The mechanism of the translational inhibition exerted by GAM1653 RNA, herein designated GAM RNA, on one or more GAM1653 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1653 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1653 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1653 RNA, herein designated GAM RNA, of GAM1653 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1653 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1653 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1653 RNA correlate with, and may be deduced from, the identity of the GAM1653 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1698 6925 GTGTGACCTT GGCCCTGTGA GGCTTCACCT CTTGAGCCTG AGAAGCAGAG GTGACAGTAC TGGCCCTGGT TCTTAGCAGG GGGGTGGCGG GCAGGGTAGG GGGTGGCGC

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 1698 (GAM1698) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM1698 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM1698 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM1698 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1698 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1698 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1698 precursor RNA is designated SEQ ID:6925, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6925 is located from position 30012807 to position 30012915 relative to chromosome 16 on the `+` strand.

GAM1698 precursor RNA folds onto itself, forming GAM1698 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1698 precursor RNA, designated SEQ ID NO: 6925, and a

schematic representation of a predicted secondary folding of GAM1698 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1698 folded precursor RNA yielding a GAM1698 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1698 RNA, hereby incorporated herein.

GAM1698 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1698 target RNA, herein designated GAM TARGET RNA. GAM1698 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1698 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1698 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1698 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1698 RNA, herein designated GAM RNA, to target binding sites on GAM1698 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1698 target RNA into GAM1698 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1698 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1698 target genes. The mRNA of each one of this plurality of GAM1698 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1698 RNA, herein designated GAM RNA, and which when bound by GAM1698 RNA causes inhibition of translation of the GAM1698 target mRNA into a corresponding GAM1698 target protein.

The mechanism of the translational inhibition exerted by GAM1698 RNA, herein designated GAM RNA, on one or more GAM1698 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1698 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1698 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1698 RNA, herein designated GAM RNA, of GAM1698 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1698 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1698 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1698 RNA correlate with, and may be deduced from, the identity of the GAM1698 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

C GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM1770 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1770

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1770

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1770 precursor RNA is designated SEQ ID:6845, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6845 is located from position 38591310 to position 38591380 relative to chromosome 17 on the `+` strand.

GAM1770 precursor RNA folds onto itself, forming GAM1770 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1770 precursor RNA, designated SEQ ID NO: 6845, and a schematic representation of a predicted secondary folding of GAM1770 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1770 folded precursor RNA yielding a GAM1770 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1770 RNA, hereby incorporated herein.

GAM1770 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1770 target RNA, herein designated GAM TARGET RNA. GAM1770 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1770 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1770 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1770 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1770 RNA, herein designated GAM RNA, to target binding sites on GAM1770 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1770 target RNA into GAM1770 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1770 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1770 target genes. The mRNA of each one of this plurality of GAM1770 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1770 RNA, herein designated GAM RNA, and which when bound by GAM1770 RNA causes inhibition of translation of the GAM1770 target mRNA into a corresponding GAM1770 target protein.

The mechanism of the translational inhibition exerted by GAM1770 RNA, herein designated GAM RNA, on one or more GAM1770 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1770 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1770 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1770 RNA, herein designated GAM RNA, of GAM1770 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1770 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1770 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1770 RNA correlate with, and may be deduced from, the identity of the GAM1770 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1782 6181 CTCTTAAACC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTTAGAAATG detected oligonucleotides of the present invention, referred to here as Genomic Address

CTACAGCATC Messenger 1782 (GAM1782) oligonucleotides modulates expression of respective target genes

TAGCTTCTCT whose function and utility is known in the art.

AGATCAATAA GAM1782 is a novel bioinformatically detectable regulatory, non protein coding,

TCACAGAGGC micro RNA (miRNA)-like oligonucleotide. The method by which GAM1782 was detected is

TTAAGTGCTG described with additional reference to Figs. 9-15.

ACCTCATAAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GATAAAGAG encoded by the human genome.

GAM1782 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1782 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1782 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1782 precursor RNA is designated SEQ ID:6181, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6181 is located from position 136594090 to position 136594178 relative to chromosome X on the `+` strand.

GAM1782 precursor RNA folds onto itself, forming GAM1782 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1782 precursor RNA, designated SEQ ID NO: 6181, and a schematic representation of a predicted secondary folding of GAM1782 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1782 folded precursor RNA yielding a GAM1782 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1782 RNA, hereby incorporated herein. Expression of GAM1782 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM1782 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1782 target RNA, herein designated GAM TARGET RNA. GAM1782 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1782 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1782 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1782 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region

or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1782 RNA, herein designated GAM RNA, to target binding sites on GAM1782 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1782 target RNA into GAM1782 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1782 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1782 target genes. The mRNA of each one of this plurality of GAM1782 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1782 RNA, herein designated GAM RNA, and which when bound by GAM1782 RNA causes inhibition of translation of the GAM1782 target mRNA into a corresponding GAM1782 target protein.

The mechanism of the translational inhibition exerted by GAM1782 RNA, herein designated GAM RNA, on one or more GAM1782 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1782 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1782 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1782 RNA, herein designated GAM RNA, of GAM1782 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1782 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1782 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1782 RNA correlate with, and may be deduced from, the identity of the GAM1782 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1820 6266 CTTGATCTGT Fig. 8 further provides a conceptual description of another novel bioinformatically

CACCCAGGCT detected oligonucleotides of the present invention, referred to here as Genomic Address

GCAGTGTAGT Messenger 1820 (GAM1820) oligonucleotides modulates expression of respective target genes

GGCATGATCT whose function and utility is known in the art.

CGGCTCACTG GAM1820 is a novel bioinformatically detectable regulatory, non protein coding,

CAACCCCCGC micro RNA (miRNA)-like oligonucleotide. The method by which GAM1820 was detected is

CTCCTGGGTT described with additional reference to Figs. 9-15.

CAAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM1820 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1820

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1820

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1820 precursor RNA is designated SEQ ID:6266, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6266 is located from position 79670256 to position 79670329 relative to chromosome 14 on the `+` strand.

GAM1820 precursor RNA folds onto itself, forming GAM1820 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1820 precursor RNA, designated SEQ ID NO: 6266, and a schematic representation of a predicted secondary folding of GAM1820 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1820 folded precursor RNA yielding a GAM1820 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1820 RNA, hereby incorporated herein.

GAM1820 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1820 target RNA, herein designated GAM TARGET RNA. GAM1820 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1820 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1820 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1820 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows

three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1820 RNA, herein designated GAM RNA, to target binding sites on GAM1820 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1820 target RNA into GAM1820 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1820 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1820 target genes. The mRNA of each one of this plurality of GAM1820 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1820 RNA, herein designated GAM RNA, and which when bound by GAM1820 RNA causes inhibition of translation of the GAM1820 target mRNA into a corresponding GAM1820 target protein.

The mechanism of the translational inhibition exerted by GAM1820 RNA, herein designated GAM RNA, on one or more GAM1820 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1820 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1820 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1820 RNA, herein designated GAM RNA, of GAM1820 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1820 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1820 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1820 RNA correlate with, and may be deduced from, the identity of the GAM1820 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1835 6959 TAATCTTAAC ATTCTCAACT Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address

ATGATTACCA Messenger 1835 (GAM1835) oligonucleotides modulates expression of respective target genes

AAGCAGAAAA whose function and utility is known in the art.

ATAAAACACA GAM1835 is a novel bioinformatically detectable regulatory, non protein coding, TTAAATCACA micro RNA (miRNA)-like oligonucleotide. The method by which GAM1835 was detected is

TGCTGGCTTA described with additional reference to Figs. 9-15.

TGAAAGCCTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CATCTTTAAG encoded by the human genome.

TGACATGTGC GAM1835 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1835

ACTCTCGTTC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1835

ATAGTTCATT precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar GGCCAAAGAA to the nucleotide sequence of GAM1835 precursor RNA is designated SEQ ID:6959, and is

provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6959 is located from position 115193597 to position 115193726 relative to chromosome 9 on the `+` strand.

GAM1835 precursor RNA folds onto itself, forming GAM1835 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1835 precursor RNA, designated SEQ ID NO: 6959, and a schematic representation of a predicted secondary folding of GAM1835 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1835 folded precursor RNA yielding a GAM1835 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1835 RNA, hereby incorporated herein.

GAM1835 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1835 target RNA, herein designated GAM TARGET RNA. GAM1835 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1835 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1835 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1835 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1835 RNA, herein designated GAM RNA, to target binding sites on GAM1835 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1835 target RNA into GAM1835 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1835 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1835 target genes. The mRNA of each one of this plurality of GAM1835 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1835 RNA, herein designated GAM RNA, and which when bound by GAM1835 RNA causes inhibition of translation of the GAM1835 target mRNA into a corresponding GAM1835 target protein.

The mechanism of the translational inhibition exerted by GAM1835 RNA, herein designated GAM RNA, on one or more GAM1835 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1835 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1835 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1835 RNA, herein designated GAM RNA, of GAM1835 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1835 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1835 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1835 RNA correlate with, and may be deduced from, the identity of the GAM1835 target gene inhibited

thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1860 7189 TGATGAAAAT Fig. 8 further provides a conceptual description of another novel bioinformatically
CCACAATGTC detected oligonucleotides of the present invention, referred to here as Genomic Address
TTTGAGCTTC Messenger 1860 (GAM1860) oligonucleotides modulates expression of respective target genes
TGGTTGTGTA whose function and utility is known in the art.

ATGCTGGGGT GAM1860 is a novel bioinformatically detectable regulatory, non protein coding,
TTAAAGTCAC micro RNA (miRNA)-like oligonucleotide. The method by which GAM1860 was detected is

CATTTGTGGG described with additional reference to Figs. 9-15.

TTTGGCATCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM1860 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1860

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1860
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1860 precursor RNA is designated SEQ ID:7189, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7189 is located from position 92812997 to position 92813076 relative to chromosome 11 on the `+` strand.

GAM1860 precursor RNA folds onto itself, forming GAM1860 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1860 precursor RNA, designated SEQ ID NO: 7189, and a schematic representation of a predicted secondary folding of GAM1860 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1860 folded precursor RNA yielding a GAM1860 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1860 RNA, hereby incorporated herein.

GAM1860 target gene, herein designated GAM TARGET GENE, encodes a corresponding

messenger RNA, GAM1860 target RNA, herein designated GAM TARGET RNA. GAM1860 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1860 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1860 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1860 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1860 RNA, herein designated GAM RNA, to target binding sites on GAM1860 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1860 target RNA into GAM1860 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1860 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1860 target genes. The mRNA of each one of this plurality of GAM1860 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1860 RNA, herein designated GAM RNA, and which when bound by GAM1860 RNA causes inhibition of translation of the GAM1860 target mRNA into a corresponding GAM1860 target protein.

The mechanism of the translational inhibition exerted by GAM1860 RNA, herein designated GAM RNA, on one or more GAM1860 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1860 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1860 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1860 RNA, herein designated GAM RNA, of GAM1860 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1860 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target

binding sites to GAM1860 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1860 RNA correlate with, and may be deduced from, the identity of the GAM1860 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TGTCTCTTAG GAM1863 is a novel bioinformatically detectable regulatory, non protein coding,
CCTGGGGAAT micro RNA (miRNA)-like oligonucleotide. The method by which GAM1863 was detected is

TAAATGAGAA described with additional reference to Figs. 9-15.

GCCTTAGAAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GGGTGGCCCT encoded by the human genome.

TGTGACCTGA GAM1863 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1863
A precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1863

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1863 precursor RNA is designated SEQ ID:7295, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7295 is located from position 65182629 to position 65182729 relative to chromosome X on the `+` strand.

GAM1863 precursor RNA folds onto itself, forming GAM1863 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1863 precursor RNA, designated SEQ ID NO: 7295, and a schematic representation of a predicted secondary folding of GAM1863 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1863 folded precursor RNA yielding a GAM1863 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an

enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1863 RNA, hereby incorporated herein.

GAM1863 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1863 target RNA, herein designated GAM TARGET RNA. GAM1863 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1863 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1863 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1863 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1863 RNA, herein designated GAM RNA, to target binding sites on GAM1863 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1863 target RNA into GAM1863 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1863 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1863 target genes. The mRNA of each one of this plurality of GAM1863 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1863 RNA, herein designated GAM RNA, and which when bound by GAM1863 RNA causes inhibition of translation of the GAM1863 target mRNA into a corresponding GAM1863 target protein.

The mechanism of the translational inhibition exerted by GAM1863 RNA, herein designated GAM RNA, on one or more GAM1863 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1863 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1863 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1863 RNA, herein designated GAM RNA, of GAM1863 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1863 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1863 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1863 RNA correlate with, and may be deduced from, the identity of the GAM1863 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1864 6072 CCCAGCATGA Fig. 8 further provides a conceptual description of another novel bioinformatically
TTCATACCTG detected oligonucleotides of the present invention, referred to here as Genomic Address
TAATCTTACC Messenger 1864 (GAM1864) oligonucleotides modulates expression of respective target genes
CATTCTTGAT whose function and utility is known in the art.

TTAGATGAGA GAM1864 is a novel bioinformatically detectable regulatory, non protein coding,
TTTGGATTTC micro RNA (miRNA)-like oligonucleotide. The method by which GAM1864 was detected is

GAGTTGATGC described with additional reference to Figs. 9-15.

TAGAATGGGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TAATACTTTT encoded by the human genome.

GAGGATGTTG GAM1864 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1864
GG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1864

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1864 precursor RNA is designated SEQ ID:6072, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6072 is located from position 89090896 to position 89090997 relative to chromosome 1 on the `-` strand.

GAM1864 precursor RNA folds onto itself, forming GAM1864 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1864 precursor RNA, designated SEQ ID NO: 6072, and a schematic representation of a predicted secondary folding of GAM1864 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1864 folded precursor RNA yielding a GAM1864 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1864 RNA, hereby incorporated herein.

GAM1864 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1864 target RNA, herein designated GAM TARGET RNA. GAM1864 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1864 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1864 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1864 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1864 RNA, herein designated GAM RNA, to target binding sites on GAM1864 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1864 target RNA into GAM1864 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1864 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1864 target genes. The mRNA of each one of this plurality of GAM1864 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1864 RNA, herein designated GAM RNA, and which when bound by GAM1864 RNA causes inhibition of translation of the GAM1864 target mRNA into a corresponding GAM1864 target protein.

The mechanism of the translational inhibition exerted by GAM1864 RNA, herein designated GAM RNA, on one or more GAM1864 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1864 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1864 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1864 RNA, herein designated GAM RNA, of GAM1864 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1864 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1864 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1864 RNA correlate with, and may be deduced from, the identity of the GAM1864 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1887 6132 CCTTTGAACC Fig. 8 further provides a conceptual description of another novel bioinformatically

CTGTGTTAAC detected oligonucleotides of the present invention, referred to here as Genomic Address

AATGAGAAGC Messenger 1887 (GAM1887) oligonucleotides modulates expression of respective target genes

TTGTTTATTT whose function and utility is known in the art.

GAAGGCTGGG GAM1887 is a novel bioinformatically detectable regulatory, non protein coding,

TTCTCATTGG micro RNA (miRNA)-like oligonucleotide. The method by which GAM1887 was detected is

CCCACAGGGG described with additional reference to Figs. 9-15.

TAGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM1887 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1887

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1887

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1887 precursor RNA is designated SEQ ID:6132, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6132 is located from position 46615376 to position 46615449 relative to chromosome 20 on the `-` strand.

GAM1887 precursor RNA folds onto itself, forming GAM1887 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1887 precursor RNA, designated SEQ ID NO: 6132, and a schematic representation of a predicted secondary folding of GAM1887 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1887 folded precursor RNA yielding a GAM1887 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1887 RNA, hereby incorporated herein.

GAM1887 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1887 target RNA, herein designated GAM TARGET RNA. GAM1887 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1887 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1887 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1887 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1887 RNA, herein designated GAM RNA, to target binding sites on GAM1887 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1887 target RNA into GAM1887 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1887 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1887 target genes. The mRNA of each one of this plurality of GAM1887 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1887 RNA, herein designated GAM RNA, and which when bound by GAM1887 RNA causes inhibition of translation of the GAM1887 target mRNA into a corresponding GAM1887 target protein.

The mechanism of the translational inhibition exerted by GAM1887 RNA, herein designated GAM RNA, on one or more GAM1887 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1887 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1887 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1887 RNA, herein designated GAM RNA, of GAM1887 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1887 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1887 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1887 RNA correlate with, and may be deduced from, the identity of the GAM1887 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1896 6059 CCATCTCTGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTATTCCTCT detected oligonucleotides of the present invention, referred to here as Genomic Address

GCCACGTCTT Messenger 1896 (GAM1896) oligonucleotides modulates expression of respective target genes

TCCCTTCTCC whose function and utility is known in the art.

TCTCTGCTCT GAM1896 is a novel bioinformatically detectable regulatory, non protein coding,

CATAAAGAAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM1896 was detected is

AATGGGAGAT described with additional reference to Figs. 9-15.

GAAAGTGGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGGCAGCTGA encoded by the human genome.

GGTGG GAM1896 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1896

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1896

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1896 precursor RNA is designated SEQ ID:6059, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6059 is located from position 21174682 to position 21174776 relative to chromosome 20 on the `+` strand.

GAM1896 precursor RNA folds onto itself, forming GAM1896 folded precursor RNA,

herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1896 precursor RNA, designated SEQ ID NO: 6059, and a schematic representation of a predicted secondary folding of GAM1896 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1896 folded precursor RNA yielding a GAM1896 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1896 RNA, hereby incorporated herein. Expression of GAM1896 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM1896 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1896 target RNA, herein designated GAM TARGET RNA. GAM1896 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1896 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1896 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1896 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1896 RNA, herein designated GAM RNA, to target binding sites on GAM1896 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1896 target RNA into GAM1896 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1896 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1896 target genes. The mRNA of each one of this plurality of GAM1896 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1896 RNA, herein

designated GAM RNA, and which when bound by GAM1896 RNA causes inhibition of translation of the GAM1896 target mRNA into a corresponding GAM1896 target protein.

The mechanism of the translational inhibition exerted by GAM1896 RNA, herein designated GAM RNA, on one or more GAM1896 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1896 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1896 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1896 RNA, herein designated GAM RNA, of GAM1896 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1896 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1896 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1896 RNA correlate with, and may be deduced from, the identity of the GAM1896 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAGTATTCAC detected oligonucleotides of the present invention, referred to here as Genomic Address
CAGGTGCTGG Messenger 1937 (GAM1937) oligonucleotides modulates expression of respective target genes
GTGGAGAAAG whose function and utility is known in the art.

AAGACTTAAA GAM1937 is a novel bioinformatically detectable regulatory, non protein coding,
GATTCCCTAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM1937 was detected is

ACATCTCCTC described with additional reference to Figs. 9-15.

TCCCCTAGAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TCAGGACCAT encoded by the human genome.

GGCACTTATT GAM1937 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1937 TTCTAGTCAA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1937 TATT precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1937 precursor RNA is designated SEQ ID:5679, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5679 is located from position 35798279 to position 35798392 relative to chromosome 9 on the `+` strand.

GAM1937 precursor RNA folds onto itself, forming GAM1937 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1937 precursor RNA, designated SEQ ID NO: 5679, and a schematic representation of a predicted secondary folding of GAM1937 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1937 folded precursor RNA yielding a GAM1937 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1937 RNA, hereby incorporated herein.

GAM1937 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1937 target RNA, herein designated GAM TARGET RNA. GAM1937 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1937 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1937 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1937 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1937 RNA, herein designated GAM RNA, to target binding sites on GAM1937 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1937 target RNA into GAM1937 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1937 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1937 target genes. The mRNA of each one of this plurality of GAM1937 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1937 RNA, herein designated GAM RNA, and which when bound by GAM1937 RNA causes inhibition of translation of the GAM1937 target mRNA into a corresponding GAM1937 target protein.

The mechanism of the translational inhibition exerted by GAM1937 RNA, herein designated GAM RNA, on one or more GAM1937 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1937 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1937 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1937 RNA, herein designated GAM RNA, of GAM1937 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1937 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1937 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1937 RNA correlate with, and may be deduced from, the identity of the GAM1937 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1942 6832 GGTAGTGGTG Fig. 8 further provides a conceptual description of another novel bioinformatically
ATTCAAAGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
AGATGGTAGC Messenger 1942 (GAM1942) oligonucleotides modulates expression of respective target genes
ATTGGAGAGG whose function and utility is known in the art.

ATGAGATATG GAM1942 is a novel bioinformatically detectable regulatory, non protein coding,
GTCAGATGAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM1942 was detected is

GATATATTTT described with additional reference to Figs. 9-15.

AAAAGTTGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CTAACAGGAT encoded by the human genome.

TTGCTGAGGA GAM1942 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1942

ATCAGAAGTG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1942

AACC precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1942 precursor RNA is designated SEQ ID:6832, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6832 is located from position 133099401 to position 133099514 relative to chromosome 7 on the `+` strand.

GAM1942 precursor RNA folds onto itself, forming GAM1942 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1942 precursor RNA, designated SEQ ID NO: 6832, and a schematic representation of a predicted secondary folding of GAM1942 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1942 folded precursor RNA yielding a GAM1942 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1942 RNA, hereby incorporated herein.

GAM1942 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1942 target RNA, herein designated GAM TARGET RNA. GAM1942 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1942 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1942 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1942 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1942 RNA, herein designated GAM RNA, to target binding sites on GAM1942 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1942 target RNA into GAM1942 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1942 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1942 target genes. The mRNA of each one of this plurality of GAM1942 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1942 RNA, herein designated GAM RNA, and which when bound by GAM1942 RNA causes inhibition of translation of the GAM1942 target mRNA into a corresponding GAM1942 target protein.

The mechanism of the translational inhibition exerted by GAM1942 RNA, herein designated GAM RNA, on one or more GAM1942 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1942 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1942 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1942 RNA, herein designated GAM RNA, of GAM1942 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1942 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1942 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1942 RNA correlate with, and may be deduced from, the identity of the GAM1942 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1961 6749 GGCCTCCCAA AGTGCTGAGA TTACAGGCAT

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 1961 (GAM1961) oligonucleotides modulates expression of respective target genes

GAGCCACTGC whose function and utility is known in the art.

ACCTGGCCCT GAM1961 is a novel bioinformatically detectable regulatory, non protein coding, TGCCTCTATT micro RNA (miRNA)-like oligonucleotide. The method by which GAM1961 was detected is

TCAAAGCTAC described with additional reference to Figs. 9-15.

TTTGGTGCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM1961 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1961

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1961

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1961 precursor RNA is designated SEQ ID:6749, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6749 is located from position 111433254 to position 111433332 relative to chromosome 12 on the `+` strand.

GAM1961 precursor RNA folds onto itself, forming GAM1961 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1961 precursor RNA, designated SEQ ID NO: 6749, and a schematic representation of a predicted secondary folding of GAM1961 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1961 folded precursor RNA yielding a GAM1961 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1961 RNA, hereby incorporated herein.

GAM1961 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1961 target RNA, herein designated GAM TARGET RNA. GAM1961 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1961 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1961 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1961 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1961 RNA, herein designated GAM RNA, to target binding sites on GAM1961 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1961 target RNA into GAM1961 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1961 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1961 target genes. The mRNA of each one of this plurality of GAM1961 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1961 RNA, herein designated GAM RNA, and which when bound by GAM1961 RNA causes inhibition of translation of the GAM1961 target mRNA into a corresponding GAM1961 target protein.

The mechanism of the translational inhibition exerted by GAM1961 RNA, herein designated GAM RNA, on one or more GAM1961 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1961 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1961 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1961 RNA, herein designated GAM RNA, of GAM1961 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1961 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1961 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1961 RNA correlate with, and may be deduced from, the identity of the GAM1961 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1975 5960 ATCTGTCTTT Fig. 8 further provides a conceptual description of another novel bioinformatically

CCAAGCCTTC detected oligonucleotides of the present invention, referred to here as Genomic Address
CCCGGGATCA Messenger 1975 (GAM1975) oligonucleotides modulates expression of respective target
genes
GAGTTTTTAA whose function and utility is known in the art.

GGATAATTTG GAM1975 is a novel bioinformatically detectable regulatory, non protein coding,
GTGGGGAGAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM1975 was detected is

GCTTGGGAAG described with additional reference to Figs. 9-15.

TGGGGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a
humen gene
encoded by the human genome.

GAM1975 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1975

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM1975
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1975 precursor RNA is designated SEQ ID:5960, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5960 is located from position 55606620 to position 55606695 relative to chromosome X on the `-` strand.

GAM1975 precursor RNA folds onto itself, forming GAM1975 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1975 precursor RNA, designated SEQ ID NO: 5960, and a schematic representation of a predicted secondary folding of GAM1975 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1975 folded precursor RNA yielding a GAM1975 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM1975 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1975 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM1975 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1975 target RNA, herein designated GAM TARGET RNA. GAM1975 target
RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1975 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1975 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1975 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1975 RNA, herein designated GAM RNA, to target binding sites on GAM1975 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1975 target RNA into GAM1975 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1975 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1975 target genes. The mRNA of each one of this plurality of GAM1975 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1975 RNA, herein designated GAM RNA, and which when bound by GAM1975 RNA causes inhibition of translation of the GAM1975 target mRNA into a corresponding GAM1975 target protein.

The mechanism of the translational inhibition exerted by GAM1975 RNA, herein designated GAM RNA, on one or more GAM1975 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1975 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1975 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1975 RNA, herein designated GAM RNA, of GAM1975 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1975 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1975 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1975 RNA correlate with, and may be deduced from, the identity of the GAM1975 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1976 6572 GGAAAATGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

GGCTCCCTCT Messenger 1976 (GAM1976) oligonucleotides modulates expression of respective target genes

CTTCTCTCCC whose function and utility is known in the art.

GTTAGGCACA GAM1976 is a novel bioinformatically detectable regulatory, non protein coding,

AGACGGTGTA micro RNA (miRNA)-like oligonucleotide. The method by which GAM1976 was detected is

AATCCTGGTC described with additional reference to Figs. 9-15.

TTCCTCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM1976 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1976

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1976

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1976 precursor RNA is designated SEQ ID:6572, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6572 is located from position 35292418 to position 35292494 relative to chromosome 21 on the `+` strand.

GAM1976 precursor RNA folds onto itself, forming GAM1976 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1976 precursor RNA, designated SEQ ID NO: 6572, and a schematic representation of a predicted secondary folding of GAM1976 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1976 folded precursor RNA yielding a GAM1976 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the

nucleotide sequence of GAM1976 RNA, hereby incorporated herein.

GAM1976 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1976 target RNA, herein designated GAM TARGET RNA. GAM1976 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1976 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1976 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1976 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1976 RNA, herein designated GAM RNA, to target binding sites on GAM1976 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1976 target RNA into GAM1976 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1976 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1976 target genes. The mRNA of each one of this plurality of GAM1976 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1976 RNA, herein designated GAM RNA, and which when bound by GAM1976 RNA causes inhibition of translation of the GAM1976 target mRNA into a corresponding GAM1976 target protein.

The mechanism of the translational inhibition exerted by GAM1976 RNA, herein designated GAM RNA, on one or more GAM1976 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1976 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1976 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1976 RNA, herein designated GAM RNA, of GAM1976 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1976 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1976 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1976 RNA correlate with, and may be deduced from, the identity of the GAM1976 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM1997 6880 GTCCCTATCA Fig. 8 further provides a conceptual description of another novel bioinformatically

CTCGGAGCGG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGACCTGAGC Messenger 1997 (GAM1997) oligonucleotides modulates expression of respective target genes

TATGAGTCAT whose function and utility is known in the art.

CAGTGAGGTG GAM1997 is a novel bioinformatically detectable regulatory, non protein coding,

CTATACTCAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM1997 was detected is

AGCCATTCCG described with additional reference to Figs. 9-15.

CTCAGGTCAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGAGGAC encoded by the human genome.

GAM1997 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM1997

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM1997

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1997 precursor RNA is designated SEQ ID:6880, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6880 is located from position 79802871 to position 79802957 relative to chromosome 4 on the `+` strand.

GAM1997 precursor RNA folds onto itself, forming GAM1997 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM1997 precursor RNA, designated SEQ ID NO: 6880, and a schematic representation of a predicted secondary folding of GAM1997 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM1997 folded precursor RNA

yielding a GAM1997 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM1997 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM1997 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM1997 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1997 target RNA, herein designated GAM TARGET RNA. GAM1997 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM1997 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1997 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1997 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM1997 RNA, herein designated GAM RNA, to target binding sites on GAM1997 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1997 target RNA into GAM1997 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM1997 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1997 target genes. The mRNA of each one of this plurality of GAM1997 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1997 RNA, herein designated GAM RNA, and which when bound by GAM1997 RNA causes inhibition of translation of the GAM1997 target mRNA into a corresponding GAM1997 target protein.

The mechanism of the translational inhibition exerted by GAM1997 RNA, herein designated GAM RNA, on one or more GAM1997 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM1997 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM1997 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM1997 RNA, herein designated GAM RNA, of GAM1997 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM1997 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM1997 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM1997 RNA correlate with, and may be deduced from, the identity of the GAM1997 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TGCACCATTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM2010 was detected is

CACTCCACCC described with additional reference to Figs. 9-15.

TAGGCAACAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGCAAAACT encoded by the human genome.

CTGT GAM2010 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2010

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2010

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2010 precursor RNA is designated SEQ ID:5689, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5689 is located from position 22660388 to position 22660481 relative to chromosome 15 on the `+` strand.

GAM2010 precursor RNA folds onto itself, forming GAM2010 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2010 precursor RNA, designated SEQ ID NO: 5689, and a schematic representation of a predicted secondary folding of GAM2010 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2010 folded precursor RNA yielding a GAM2010 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2010 RNA, hereby incorporated herein.

GAM2010 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2010 target RNA, herein designated GAM TARGET RNA. GAM2010 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2010 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2010 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2010 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2010 RNA, herein designated GAM RNA, to target binding sites on GAM2010 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2010 target RNA into GAM2010 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2010 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2010 target genes. The mRNA of each one of this plurality of GAM2010 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2010 RNA, herein designated GAM RNA, and which when bound by GAM2010 RNA causes inhibition of translation of the GAM2010 target mRNA into a corresponding GAM2010 target protein.

The mechanism of the translational inhibition exerted by GAM2010 RNA, herein designated GAM RNA, on one or more GAM2010 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2010 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2010 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2010 RNA, herein designated GAM RNA, of GAM2010 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2010 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2010 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2010 RNA correlate with, and may be deduced from, the identity of the GAM2010 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2014 6737 GGCAGGGAGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TGACGAGGTA detected oligonucleotides of the present invention, referred to here as Genomic Address

GGGGCAGAGC Messenger 2014 (GAM2014) oligonucleotides modulates expression of respective target genes

GGATGGAAGC whose function and utility is known in the art.

CGGAGATCCC GAM2014 is a novel bioinformatically detectable regulatory, non protein coding,

AGGTTCCCGG micro RNA (miRNA)-like oligonucleotide. The method by which GAM2014 was detected is

AATACTCCGG described with additional reference to Figs. 9-15.

CTGGGGCCTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CGGGCTTCTC encoded by the human genome.

CTGTCCCCTC GAM2014 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2014

CCTACCCCCG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2014

TGCCTCGGGT precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar

TTCTCCCTCC to the nucleotide sequence of GAM2014 precursor RNA is designated SEQ ID:6737, and is

provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6737 is located from position 76816688 to position 76816817 relative to chromosome 17 on the `-` strand.

GAM2014 precursor RNA folds onto itself, forming GAM2014 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2014 precursor RNA, designated SEQ ID NO: 6737, and a schematic representation of a predicted secondary folding of GAM2014 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2014 folded precursor RNA yielding a GAM2014 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2014 RNA, hereby incorporated herein.

GAM2014 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2014 target RNA, herein designated GAM TARGET RNA. GAM2014 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2014 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2014 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2014 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2014 RNA, herein designated GAM RNA, to target binding sites on GAM2014 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2014 target RNA into GAM2014 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2014 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2014 target genes. The mRNA of each one of this plurality of GAM2014 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2014 RNA, herein designated GAM RNA, and which when bound by GAM2014 RNA causes inhibition of translation

of the GAM2014 target mRNA into a corresponding GAM2014 target protein.

The mechanism of the translational inhibition exerted by GAM2014 RNA, herein designated GAM RNA, on one or more GAM2014 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2014 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2014 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2014 RNA, herein designated GAM RNA, of GAM2014 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2014 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2014 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2014 RNA correlate with, and may be deduced from, the identity of the GAM2014 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2022 6313 GACCATGAAG Fig. 8 further provides a conceptual description of another novel bioinformatically
CCAGAGTCTC detected oligonucleotides of the present invention, referred to here as Genomic Address
CAGGACTCCT Messenger 2022 (GAM2022) oligonucleotides modulates expression of respective target genes
CACTCAACCT whose function and utility is known in the art.

CGGCCATGGA GAM2022 is a novel bioinformatically detectable regulatory, non protein coding,
CGCAGGTTGG micro RNA (miRNA)-like oligonucleotide. The method by which GAM2022 was detected is

GTGTGAGGGG described with additional reference to Figs. 9-15.

GGTCCCAGCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTTCGGTCTT encoded by the human genome.

CTATTTC GAM2022 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2022
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2022
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of GAM2022 precursor RNA is designated SEQ ID:6313, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6313 is located from position 47568406 to position 47568502 relative to chromosome 10 on the `+` strand.

GAM2022 precursor RNA folds onto itself, forming GAM2022 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2022 precursor RNA, designated SEQ ID NO: 6313, and a schematic representation of a predicted secondary folding of GAM2022 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2022 folded precursor RNA yielding a GAM2022 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2022 RNA, hereby incorporated herein.

GAM2022 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2022 target RNA, herein designated GAM TARGET RNA. GAM2022 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2022 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2022 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2022 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2022 RNA, herein designated GAM RNA, to target binding sites on GAM2022 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2022 target RNA into GAM2022 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2022 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2022 target genes. The mRNA of each one of this plurality of GAM2022 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2022 RNA, herein designated GAM RNA, and which when bound by GAM2022 RNA causes inhibition of translation of the GAM2022 target mRNA into a corresponding GAM2022 target protein.

The mechanism of the translational inhibition exerted by GAM2022 RNA, herein designated GAM RNA, on one or more GAM2022 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2022 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2022 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2022 RNA, herein designated GAM RNA, of GAM2022 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2022 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2022 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2022 RNA correlate with, and may be deduced from, the identity of the GAM2022 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2027 6522 GCTACTTCTA Fig. 8 further provides a conceptual description of another novel bioinformatically
TGTGTCCCAT detected oligonucleotides of the present invention, referred to here as Genomic Address
GGTACTGCCA Messenger 2027 (GAM2027) oligonucleotides modulates expression of respective target genes
CAGAAGAGTC whose function and utility is known in the art.

TCAGCTCTCT GAM2027 is a novel bioinformatically detectable regulatory, non protein coding,
CCAGGATTCA micro RNA (miRNA)-like oligonucleotide. The method by which GAM2027 was detected is

GTTCTAAGGT described with additional reference to Figs. 9-15.

CAGTGCCTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GATAAAAATG encoded by the human genome.

GAGTGT GAM2027 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2027 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2027 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2027 precursor RNA is designated SEQ ID:6522, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6522 is located from position 3662454 to position 3662549 relative to chromosome 17 on the `-` strand.

GAM2027 precursor RNA folds onto itself, forming GAM2027 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2027 precursor RNA, designated SEQ ID NO: 6522, and a schematic representation of a predicted secondary folding of GAM2027 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2027 folded precursor RNA yielding a GAM2027 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2027 RNA, hereby incorporated herein.

GAM2027 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2027 target RNA, herein designated GAM TARGET RNA. GAM2027 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2027 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2027 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2027 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2027 RNA, herein designated GAM RNA, to target

binding sites on GAM2027 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2027 target RNA into GAM2027 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2027 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2027 target genes. The mRNA of each one of this plurality of GAM2027 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2027 RNA, herein designated GAM RNA, and which when bound by GAM2027 RNA causes inhibition of translation of the GAM2027 target mRNA into a corresponding GAM2027 target protein.

The mechanism of the translational inhibition exerted by GAM2027 RNA, herein designated GAM RNA, on one or more GAM2027 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2027 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2027 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2027 RNA, herein designated GAM RNA, of GAM2027 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2027 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2027 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2027 RNA correlate with, and may be deduced from, the identity of the GAM2027 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2033 6291 GAAGAAGAAG Fig. 8 further provides a conceptual description of another novel bioinformatically
AATGGGTTTG detected oligonucleotides of the present invention, referred to here as Genomic Address
GTGAGAGGGT Messenger 2033 (GAM2033) oligonucleotides modulates expression of respective target genes
TCCAATATTA whose function and utility is known in the art.

ACAACCCAAC GAM2033 is a novel bioinformatically detectable regulatory, non protein coding,
TTCAAGCTCA micro RNA (miRNA)-like oligonucleotide. The method by which GAM2033 was detected is

TTCCTCTAAC described with additional reference to Figs. 9-15.

CTCTTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM2033 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2033 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2033 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2033 precursor RNA is designated SEQ ID:6291, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6291 is located from position 52243579 to position 52243654 relative to chromosome 1 on the `+` strand.

GAM2033 precursor RNA folds onto itself, forming GAM2033 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2033 precursor RNA, designated SEQ ID NO: 6291, and a schematic representation of a predicted secondary folding of GAM2033 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2033 folded precursor RNA yielding a GAM2033 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2033 RNA, hereby incorporated herein. Expression of GAM2033 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM2033 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2033 target RNA, herein designated GAM TARGET RNA. GAM2033 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2033 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2033 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2033 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING

SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2033 RNA, herein designated GAM RNA, to target binding sites on GAM2033 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2033 target RNA into GAM2033 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2033 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2033 target genes. The mRNA of each one of this plurality of GAM2033 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2033 RNA, herein designated GAM RNA, and which when bound by GAM2033 RNA causes inhibition of translation of the GAM2033 target mRNA into a corresponding GAM2033 target protein.

The mechanism of the translational inhibition exerted by GAM2033 RNA, herein designated GAM RNA, on one or more GAM2033 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2033 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2033 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2033 RNA, herein designated GAM RNA, of GAM2033 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2033 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2033 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2033 RNA correlate with, and may be deduced from, the identity of the GAM2033 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2051 6003 CACTCTGTAA TAAAGAACTT GGAAAGGGAG

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 2051 (GAM2051) oligonucleotides modulates expression of respective target genes

GTTCCAAGAT whose function and utility is known in the art.

GGCCAAATAT GAM2051 is a novel bioinformatically detectable regulatory, non protein coding, GAACAGCTCC micro RNA (miRNA)-like oligonucleotide. The method by which GAM2051 was detected is

AGTCTACAGC described with additional reference to Figs. 9-15.

CCCCAGCGTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGTG encoded by the human genome.

GAM2051 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2051 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2051 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2051 precursor RNA is designated SEQ ID:6003, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6003 is located from position 27725973 to position 27726056 relative to chromosome 11 on the `+` strand.

GAM2051 precursor RNA folds onto itself, forming GAM2051 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2051 precursor RNA, designated SEQ ID NO: 6003, and a schematic representation of a predicted secondary folding of GAM2051 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2051 folded precursor RNA yielding a GAM2051 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2051 RNA, hereby incorporated herein.

GAM2051 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2051 target RNA, herein designated GAM TARGET RNA. GAM2051 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2051 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2051 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2051 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2051 RNA, herein designated GAM RNA, to target binding sites on GAM2051 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2051 target RNA into GAM2051 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2051 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2051 target genes. The mRNA of each one of this plurality of GAM2051 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2051 RNA, herein designated GAM RNA, and which when bound by GAM2051 RNA causes inhibition of translation of the GAM2051 target mRNA into a corresponding GAM2051 target protein.

The mechanism of the translational inhibition exerted by GAM2051 RNA, herein designated GAM RNA, on one or more GAM2051 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2051 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2051 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2051 RNA, herein designated GAM RNA, of GAM2051 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2051 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2051 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2051 RNA correlate with, and may be deduced from, the identity of the GAM2051 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2058 6568 GCTTTGAAAG Fig. 8 further provides a conceptual description of another novel bioinformatically
AGATGTGGTG detected oligonucleotides of the present invention, referred to here as Genomic Address
TGTGAAGACG Messenger 2058 (GAM2058) oligonucleotides modulates expression of respective target genes
AAGATGCCTT whose function and utility is known in the art.

TTGTTTGTCT GAM2058 is a novel bioinformatically detectable regulatory, non protein coding,
TTGGAGAATA micro RNA (miRNA)-like oligonucleotide. The method by which GAM2058 was detected is

TTGCAACACT described with additional reference to Figs. 9-15.

ACAAAAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM2058 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2058

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2058
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2058 precursor RNA is designated SEQ ID:6568, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6568 is located from position 89111973 to position 89112050 relative to chromosome 15 on the `-` strand.

GAM2058 precursor RNA folds onto itself, forming GAM2058 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2058 precursor RNA, designated SEQ ID NO: 6568, and a schematic representation of a predicted secondary folding of GAM2058 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2058 folded precursor RNA yielding a GAM2058 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2058 RNA, hereby incorporated herein.

GAM2058 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2058 target RNA, herein designated GAM TARGET RNA. GAM2058 target RNA
comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated

region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2058 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2058 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2058 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2058 RNA, herein designated GAM RNA, to target binding sites on GAM2058 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2058 target RNA into GAM2058 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2058 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2058 target genes. The mRNA of each one of this plurality of GAM2058 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2058 RNA, herein designated GAM RNA, and which when bound by GAM2058 RNA causes inhibition of translation of the GAM2058 target mRNA into a corresponding GAM2058 target protein.

The mechanism of the translational inhibition exerted by GAM2058 RNA, herein designated GAM RNA, on one or more GAM2058 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2058 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2058 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2058 RNA, herein designated GAM RNA, of GAM2058 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2058 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2058 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2058 RNA correlate with, and may be deduced from, the identity of the GAM2058 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2062 7236 TGGGCGCCTG Fig. 8 further provides a conceptual description of another novel bioinformatically

TAATCTCAGC detected oligonucleotides of the present invention, referred to here as Genomic Address

TACTTGGGAG Messenger 2062 (GAM2062) oligonucleotides modulates expression of respective target genes

GCTGAGACAG whose function and utility is known in the art.

AGAATTGCTT GAM2062 is a novel bioinformatically detectable regulatory, non protein coding,

GAACCCAGGA micro RNA (miRNA)-like oligonucleotide. The method by which GAM2062 was detected is

GGCGGAGGTT described with additional reference to Figs. 9-15.

GCAGTGAGCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TA encoded by the human genome.

GAM2062 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2062

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2062

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2062 precursor RNA is designated SEQ ID:7236, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7236 is located from position 97732458 to position 97732539 relative to chromosome 13 on the `+` strand.

GAM2062 precursor RNA folds onto itself, forming GAM2062 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2062 precursor RNA, designated SEQ ID NO: 7236, and a schematic representation of a predicted secondary folding of GAM2062 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2062 folded precursor RNA yielding a GAM2062 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2062 RNA, hereby incorporated herein.

GAM2062 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2062 target RNA, herein designated GAM TARGET RNA. GAM2062 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2062 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2062 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2062 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2062 RNA, herein designated GAM RNA, to target binding sites on GAM2062 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2062 target RNA into GAM2062 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2062 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2062 target genes. The mRNA of each one of this plurality of GAM2062 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2062 RNA, herein designated GAM RNA, and which when bound by GAM2062 RNA causes inhibition of translation of the GAM2062 target mRNA into a corresponding GAM2062 target protein.

The mechanism of the translational inhibition exerted by GAM2062 RNA, herein designated GAM RNA, on one or more GAM2062 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2062 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2062 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2062 RNA, herein designated GAM RNA, of GAM2062 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM2062 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2062 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2062 RNA correlate with, and may be deduced from, the identity of the GAM2062 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

ATAGGCTGCC Messenger 2171 (GAM2171) oligonucleotides modulates expression of respective target genes

AGTTGGACTA whose function and utility is known in the art.

AGGAAGCCAC GAM2171 is a novel bioinformatically detectable regulatory, non protein coding,

TCCTGCGGAA micro RNA (miRNA)-like oligonucleotide. The method by which GAM2171 was detected is

CCCTGGGAG described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM2171 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2171

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2171

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2171 precursor RNA is designated SEQ ID:6165, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6165 is located from position 54026270 to position 54026338 relative to chromosome 8 on the `+` strand.

GAM2171 precursor RNA folds onto itself, forming GAM2171 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2171 precursor RNA, designated SEQ ID NO: 6165, and a schematic representation of a predicted secondary folding of GAM2171 folded precursor RNA,

herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2171 folded precursor RNA yielding a GAM2171 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2171 RNA, hereby incorporated herein.

GAM2171 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2171 target RNA, herein designated GAM TARGET RNA. GAM2171 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2171 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2171 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2171 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2171 RNA, herein designated GAM RNA, to target binding sites on GAM2171 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2171 target RNA into GAM2171 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2171 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2171 target genes. The mRNA of each one of this plurality of GAM2171 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2171 RNA, herein designated GAM RNA, and which when bound by GAM2171 RNA causes inhibition of translation of the GAM2171 target mRNA into a corresponding GAM2171 target protein.

The mechanism of the translational inhibition exerted by GAM2171 RNA, herein designated GAM RNA, on one or more GAM2171 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2171 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM2171 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2171 RNA, herein designated GAM RNA, of GAM2171 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2171 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2171 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2171 RNA correlate with, and may be deduced from, the identity of the GAM2171 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2221 5975 ATGTCCAAAG Fig. 8 further provides a conceptual description of another novel bioinformatically

ACTCAACAGT detected oligonucleotides of the present invention, referred to here as Genomic Address

TAGACTACTT Messenger 2221 (GAM2221) oligonucleotides modulates expression of respective target genes

TTCTTCCACT whose function and utility is known in the art.

CATTTTAAAG GAM2221 is a novel bioinformatically detectable regulatory, non protein coding,

AAAAATGTCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM2221 was detected is

ATGAAGTGTT described with additional reference to Figs. 9-15.

TTGGATAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM2221 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2221

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2221

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2221 precursor RNA is designated SEQ ID:5975, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5975 is located from position 13327337 to position 13327414 relative to chromosome 20 on the `+` strand.

GAM2221 precursor RNA folds onto itself, forming GAM2221 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2221 precursor RNA, designated SEQ ID NO: 5975, and a schematic representation of a predicted secondary folding of GAM2221 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2221 folded precursor RNA yielding a GAM2221 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2221 RNA, hereby incorporated herein.

GAM2221 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2221 target RNA, herein designated GAM TARGET RNA. GAM2221 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2221 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2221 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2221 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2221 RNA, herein designated GAM RNA, to target binding sites on GAM2221 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2221 target RNA into GAM2221 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2221 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2221 target genes. The mRNA of each one of this plurality of GAM2221 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2221 RNA, herein designated GAM RNA, and which when bound by GAM2221 RNA causes inhibition of translation of the GAM2221 target mRNA into a corresponding GAM2221 target protein.

The mechanism of the translational inhibition exerted by GAM2221 RNA, herein designated GAM RNA, on one or more GAM2221 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2221 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2221 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2221 RNA, herein designated GAM RNA, of GAM2221 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2221 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2221 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2221 RNA correlate with, and may be deduced from, the identity of the GAM2221 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2223 7077 TCTTACCCCA Fig. 8 further provides a conceptual description of another novel bioinformatically

GTATCCTATT detected oligonucleotides of the present invention, referred to here as Genomic Address

ATCTCATACC Messenger 2223 (GAM2223) oligonucleotides modulates expression of respective target genes

TAAGGCAGTG whose function and utility is known in the art.

ATGGTTTCTC GAM2223 is a novel bioinformatically detectable regulatory, non protein coding,

AGACCTCTTA micro RNA (miRNA)-like oligonucleotide. The method by which GAM2223 was detected is

GATTGAGAAG described with additional reference to Figs. 9-15.

ATGTGGCATG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGTGTAAGG encoded by the human genome.

GAM2223 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2223

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2223

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2223 precursor RNA is designated SEQ ID:7077, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7077 is located from position 50175599 to position 50175687 relative to chromosome 20 on the `-` strand.

GAM2223 precursor RNA folds onto itself, forming GAM2223 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2223 precursor RNA, designated SEQ ID NO: 7077, and a schematic representation of a predicted secondary folding of GAM2223 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2223 folded precursor RNA yielding a GAM2223 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2223 RNA, hereby incorporated herein.

GAM2223 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2223 target RNA, herein designated GAM TARGET RNA. GAM2223 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2223 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2223 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2223 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2223 RNA, herein designated GAM RNA, to target binding sites on GAM2223 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2223 target RNA into GAM2223 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2223 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2223 target genes. The mRNA of each one of this plurality of GAM2223 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2223 RNA, herein

designated GAM RNA, and which when bound by GAM2223 RNA causes inhibition of translation of the GAM2223 target mRNA into a corresponding GAM2223 target protein.

The mechanism of the translational inhibition exerted by GAM2223 RNA, herein designated GAM RNA, on one or more GAM2223 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2223 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2223 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2223 RNA, herein designated GAM RNA, of GAM2223 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2223 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2223 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2223 RNA correlate with, and may be deduced from, the identity of the GAM2223 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2233 5810 AGTCTCTCTC Fig. 8 further provides a conceptual description of another novel bioinformatically
TGGCTGGACC detected oligonucleotides of the present invention, referred to here as Genomic Address
TGGACTGCAG Messenger 2233 (GAM2233) oligonucleotides modulates expression of respective target genes
TCACACTCTA whose function and utility is known in the art.

AGAGCTCCTC GAM2233 is a novel bioinformatically detectable regulatory, non protein coding,
TTTCTACACC micro RNA (miRNA)-like oligonucleotide. The method by which GAM2233 was detected is

TCTGCCAGTG described with additional reference to Figs. 9-15.

GGCGTTCGGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAGAGACAAG encoded by the human genome.

CT GAM2233 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2233
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2233

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2233 precursor RNA is designated SEQ ID:5810, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5810 is located from position 167487173 to position 167487264 relative to chromosome 6 on the `-` strand.

GAM2233 precursor RNA folds onto itself, forming GAM2233 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2233 precursor RNA, designated SEQ ID NO: 5810, and a schematic representation of a predicted secondary folding of GAM2233 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2233 folded precursor RNA yielding a GAM2233 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM2233 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2233 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM2233 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2233 target RNA, herein designated GAM TARGET RNA. GAM2233 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2233 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2233 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2233 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2233 RNA, herein designated GAM RNA, to target binding sites on GAM2233 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2233 target RNA into GAM2233 target protein, herein designated GAM TARGET PROTEIN,, which is shown

surrounded by a broken line.

It is appreciated that GAM2233 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2233 target genes. The mRNA of each one of this plurality of GAM2233 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2233 RNA, herein designated GAM RNA, and which when bound by GAM2233 RNA causes inhibition of translation of the GAM2233 target mRNA into a corresponding GAM2233 target protein.

The mechanism of the translational inhibition exerted by GAM2233 RNA, herein designated GAM RNA, on one or more GAM2233 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2233 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2233 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2233 RNA, herein designated GAM RNA, of GAM2233 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2233 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2233 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2233 RNA correlate with, and may be deduced from, the identity of the GAM2233 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2251 7227 TGGCCTCTGG Fig. 8 further provides a conceptual description of another novel bioinformatically

GACTCAGATT detected oligonucleotides of the present invention, referred to here as Genomic Address

CCTCCTCTTT Messenger 2251 (GAM2251) oligonucleotides modulates expression of respective target genes

AAAATGGTGC whose function and utility is known in the art.

TAATAATAGC GAM2251 is a novel bioinformatically detectable regulatory, non protein coding,

ACCCACCCTC micro RNA (miRNA)-like oligonucleotide. The method by which GAM2251 was detected is

TGTGAGGAGG described with additional reference to Figs. 9-15.

ATGCTGTGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GACAAAATGA encoded by the human genome.

GATCA GAM2251 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2251 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2251 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2251 precursor RNA is designated SEQ ID:7227, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7227 is located from position 17124868 to position 17124962 relative to chromosome 7 on the `+` strand.

GAM2251 precursor RNA folds onto itself, forming GAM2251 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2251 precursor RNA, designated SEQ ID NO: 7227, and a schematic representation of a predicted secondary folding of GAM2251 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2251 folded precursor RNA yielding a GAM2251 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM2251 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2251 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM2251 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2251 target RNA, herein designated GAM TARGET RNA. GAM2251 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2251 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2251 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2251 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region

or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2251 RNA, herein designated GAM RNA, to target binding sites on GAM2251 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2251 target RNA into GAM2251 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2251 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2251 target genes. The mRNA of each one of this plurality of GAM2251 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2251 RNA, herein designated GAM RNA, and which when bound by GAM2251 RNA causes inhibition of translation of the GAM2251 target mRNA into a corresponding GAM2251 target protein.

The mechanism of the translational inhibition exerted by GAM2251 RNA, herein designated GAM RNA, on one or more GAM2251 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2251 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2251 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2251 RNA, herein designated GAM RNA, of GAM2251 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2251 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2251 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2251 RNA correlate with, and may be deduced from, the identity of the GAM2251 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2260 6579 GGAAGCATCC Fig. 8 further provides a conceptual description of another novel bioinformatically

CTGCTGCGGA detected oligonucleotides of the present invention, referred to here as Genomic Address

CGCTTTCACT Messenger 2260 (GAM2260) oligonucleotides modulates expression of respective target genes

TCTAAAGAGT whose function and utility is known in the art.

CTTGTCTGCT GAM2260 is a novel bioinformatically detectable regulatory, non protein coding,

AATAAGAGTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM2260 was detected is

CCCATGGCCC described with additional reference to Figs. 9-15.

AGGGTGGCAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAGGGGGATT encoded by the human genome.

TAGAAAGGGC GAM2260 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2260

ATGATGATGG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2260

CACTAGCGGC precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar

TGCTTTC to the nucleotide sequence of GAM2260 precursor RNA is designated SEQ ID:6579, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6579 is located from position 29926532 to position 29926658 relative to chromosome 10 on the `+` strand.

GAM2260 precursor RNA folds onto itself, forming GAM2260 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2260 precursor RNA, designated SEQ ID NO: 6579, and a schematic representation of a predicted secondary folding of GAM2260 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2260 folded precursor RNA yielding a GAM2260 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2260 RNA, hereby incorporated herein.

GAM2260 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2260 target RNA, herein designated GAM TARGET RNA. GAM2260 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2260 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2260 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2260 RNA is a partial or fully complementary sequence of the

nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2260 RNA, herein designated GAM RNA, to target binding sites on GAM2260 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2260 target RNA into GAM2260 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2260 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2260 target genes. The mRNA of each one of this plurality of GAM2260 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2260 RNA, herein designated GAM RNA, and which when bound by GAM2260 RNA causes inhibition of translation of the GAM2260 target mRNA into a corresponding GAM2260 target protein.

The mechanism of the translational inhibition exerted by GAM2260 RNA, herein designated GAM RNA, on one or more GAM2260 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2260 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2260 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2260 RNA, herein designated GAM RNA, of GAM2260 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2260 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2260 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2260 RNA correlate with, and may be deduced from, the identity of the GAM2260 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CTAGCTAGAG Messenger 2262 (GAM2262) oligonucleotides modulates expression of respective target genes
TCCAGGAGTT whose function and utility is known in the art.

CAGGATTAAA GAM2262 is a novel bioinformatically detectable regulatory, non protein coding,
ATGAGCTATG micro RNA (miRNA)-like oligonucleotide. The method by which GAM2262 was detected is

ATCATACCAC described with additional reference to Figs. 9-15.

TGCACTCCAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CCT encoded by the human genome.

GAM2262 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2262

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2262

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2262 precursor RNA is designated SEQ ID:5779, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5779 is located from position 42901138 to position 42901220 relative to chromosome 20 on the `+` strand.

GAM2262 precursor RNA folds onto itself, forming GAM2262 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2262 precursor RNA, designated SEQ ID NO: 5779, and a schematic representation of a predicted secondary folding of GAM2262 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2262 folded precursor RNA yielding a GAM2262 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2262 RNA, hereby incorporated herein.

GAM2262 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2262 target RNA, herein designated GAM TARGET RNA. GAM2262 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2262 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2262 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2262 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2262 RNA, herein designated GAM RNA, to target binding sites on GAM2262 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2262 target RNA into GAM2262 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2262 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2262 target genes. The mRNA of each one of this plurality of GAM2262 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2262 RNA, herein designated GAM RNA, and which when bound by GAM2262 RNA causes inhibition of translation of the GAM2262 target mRNA into a corresponding GAM2262 target protein.

The mechanism of the translational inhibition exerted by GAM2262 RNA, herein designated GAM RNA, on one or more GAM2262 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2262 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2262 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2262 RNA, herein designated GAM RNA, of GAM2262 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2262 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2262 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2262 RNA correlate with, and may be deduced from, the identity of the GAM2262 target gene inhibited

thereby, whose functions are set forth in Table 8, incorporated herein.

GACTTTCCCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM2263 was detected is

TATCCTAAAT described with additional reference to Figs. 9-15.

GTGTTTTGAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GGCACACGTT encoded by the human genome.

ATTTCCATTG GAM2263 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2263
TCATT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2263

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2263 precursor RNA is designated SEQ ID:5674, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5674 is located from position 40238503 to position 40238607 relative to chromosome 22 on the `-` strand.

GAM2263 precursor RNA folds onto itself, forming GAM2263 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2263 precursor RNA, designated SEQ ID NO: 5674, and a schematic representation of a predicted secondary folding of GAM2263 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2263 folded precursor RNA yielding a GAM2263 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM2263 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2263 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM2263 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2263 target RNA, herein designated GAM TARGET RNA. GAM2263 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2263 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2263 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2263 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2263 RNA, herein designated GAM RNA, to target binding sites on GAM2263 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2263 target RNA into GAM2263 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2263 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2263 target genes. The mRNA of each one of this plurality of GAM2263 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2263 RNA, herein designated GAM RNA, and which when bound by GAM2263 RNA causes inhibition of translation of the GAM2263 target mRNA into a corresponding GAM2263 target protein.

The mechanism of the translational inhibition exerted by GAM2263 RNA, herein designated GAM RNA, on one or more GAM2263 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2263 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2263 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2263 RNA, herein designated GAM RNA, of GAM2263 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2263 target RNA, herein designated GAM

TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2263 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2263 RNA correlate with, and may be deduced from, the identity of the GAM2263 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2270 6896 GTGACTTTCC Fig. 8 further provides a conceptual description of another novel bioinformatically
AGGTGTCACA detected oligonucleotides of the present invention, referred to here as Genomic Address
CAGTGAGTGG Messenger 2270 (GAM2270) oligonucleotides modulates expression of respective target genes
CATAATCAGA whose function and utility is known in the art.

GTACAATTTG GAM2270 is a novel bioinformatically detectable regulatory, non protein coding,
AGTCATGCCC micro RNA (miRNA)-like oligonucleotide. The method by which GAM2270 was detected is

ATACATCACA described with additional reference to Figs. 9-15.

TTGCCAGTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTACCCAAGG encoded by the human genome.

AAAGTGAC GAM2270 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2270
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2270
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2270 precursor RNA is designated SEQ ID:6896, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6896 is located from position 19237261 to position 19237358 relative to chromosome X on the `-` strand.

GAM2270 precursor RNA folds onto itself, forming GAM2270 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2270 precursor RNA, designated SEQ ID NO: 6896, and a schematic representation of a predicted secondary folding of GAM2270 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2270 folded precursor RNA yielding a GAM2270 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor

product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2270 RNA, hereby incorporated herein. Expression of GAM2270 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM2270 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2270 target RNA, herein designated GAM TARGET RNA. GAM2270 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2270 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2270 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2270 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2270 RNA, herein designated GAM RNA, to target binding sites on GAM2270 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2270 target RNA into GAM2270 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2270 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2270 target genes. The mRNA of each one of this plurality of GAM2270 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2270 RNA, herein designated GAM RNA, and which when bound by GAM2270 RNA causes inhibition of translation of the GAM2270 target mRNA into a corresponding GAM2270 target protein.

The mechanism of the translational inhibition exerted by GAM2270 RNA, herein designated GAM RNA, on one or more GAM2270 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2270 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2270 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2270 RNA, herein designated GAM RNA, of GAM2270 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2270 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2270 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2270 RNA correlate with, and may be deduced from, the identity of the GAM2270 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2272 5946 ATAAGCTGCT Fig. 8 further provides a conceptual description of another novel bioinformatically

CTAATTGCCA detected oligonucleotides of the present invention, referred to here as Genomic Address

AGAATTCACA Messenger 2272 (GAM2272) oligonucleotides modulates expression of respective target genes

TGTGGTTGTA whose function and utility is known in the art.

TGCAGCTTTA GAM2272 is a novel bioinformatically detectable regulatory, non protein coding,

CTGGGAGACT micro RNA (miRNA)-like oligonucleotide. The method by which GAM2272 was detected is

GAAGTGTATC described with additional reference to Figs. 9-15.

TGCATGTGAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TCTGCTGTGA encoded by the human genome.

TGGACACTTG GAM2272 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2272

T precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2272

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2272 precursor RNA is designated SEQ ID:5946, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5946 is located from position 62131109 to position 62131209 relative to chromosome 9 on the `-` strand.

GAM2272 precursor RNA folds onto itself, forming GAM2272 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2272 precursor RNA, designated SEQ ID NO: 5946, and a

schematic representation of a predicted secondary folding of GAM2272 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2272 folded precursor RNA yielding a GAM2272 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2272 RNA, hereby incorporated herein.

GAM2272 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2272 target RNA, herein designated GAM TARGET RNA. GAM2272 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2272 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2272 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2272 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2272 RNA, herein designated GAM RNA, to target binding sites on GAM2272 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2272 target RNA into GAM2272 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2272 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2272 target genes. The mRNA of each one of this plurality of GAM2272 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2272 RNA, herein designated GAM RNA, and which when bound by GAM2272 RNA causes inhibition of translation of the GAM2272 target mRNA into a corresponding GAM2272 target protein.

The mechanism of the translational inhibition exerted by GAM2272 RNA, herein designated GAM RNA, on one or more GAM2272 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2272 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2272 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2272 RNA, herein designated GAM RNA, of GAM2272 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2272 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2272 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2272 RNA correlate with, and may be deduced from, the identity of the GAM2272 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2306 RNA, hereby incorporated herein.

GAM2306 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2306 target RNA, herein designated GAM TARGET RNA. GAM2306 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2306 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2306 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2306 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2306 RNA, herein designated GAM RNA, to target binding sites on GAM2306 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2306 target RNA

into GAM2306 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2306 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2306 target genes. The mRNA of each one of this plurality of GAM2306 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2306 RNA, herein designated GAM RNA, and which when bound by GAM2306 RNA causes inhibition of translation of the GAM2306 target mRNA into a corresponding GAM2306 target protein.

The mechanism of the translational inhibition exerted by GAM2306 RNA, herein designated GAM RNA, on one or more GAM2306 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2306 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2306 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2306 RNA, herein designated GAM RNA, of GAM2306 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2306 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2306 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2306 RNA correlate with, and may be deduced from, the identity of the GAM2306 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2309 6076 CCCCACCCCA Fig. 8 further provides a conceptual description of another novel bioinformatically

GTGGAGCTCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CCTTCCAGTA Messenger 2309 (GAM2309) oligonucleotides modulates expression of respective target genes

GGTCTAAACT whose function and utility is known in the art.

GGTTTGATTG GAM2309 is a novel bioinformatically detectable regulatory, non protein coding,

AGTTCCATGG micro RNA (miRNA)-like oligonucleotide. The method by which GAM2309 was detected is

AAAACAACAA described with additional reference to Figs. 9-15.

AGTGGGGTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGGG encoded by the human genome.

GAM2309 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2309 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2309 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2309 precursor RNA is designated SEQ ID:6076, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6076 is located from position 124008737 to position 124008820 relative to chromosome 9 on the `+` strand.

GAM2309 precursor RNA folds onto itself, forming GAM2309 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2309 precursor RNA, designated SEQ ID NO: 6076, and a schematic representation of a predicted secondary folding of GAM2309 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2309 folded precursor RNA yielding a GAM2309 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM2309 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2309 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM2309 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2309 target RNA, herein designated GAM TARGET RNA. GAM2309 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2309 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2309 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2309 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region

or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2309 RNA, herein designated GAM RNA, to target binding sites on GAM2309 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2309 target RNA into GAM2309 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2309 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2309 target genes. The mRNA of each one of this plurality of GAM2309 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2309 RNA, herein designated GAM RNA, and which when bound by GAM2309 RNA causes inhibition of translation of the GAM2309 target mRNA into a corresponding GAM2309 target protein.

The mechanism of the translational inhibition exerted by GAM2309 RNA, herein designated GAM RNA, on one or more GAM2309 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2309 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2309 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2309 RNA, herein designated GAM RNA, of GAM2309 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2309 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2309 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2309 RNA correlate with, and may be deduced from, the identity of the GAM2309 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2350 5647 AAACGGATGG Fig. 8 further provides a conceptual description of another novel bioinformatically

GCCTGGGGGC detected oligonucleotides of the present invention, referred to here as Genomic Address

CACTTTGCAC Messenger 2350 (GAM2350) oligonucleotides modulates expression of respective target genes

AGGGTTCTCC whose function and utility is known in the art.

AGAGCCCTGC GAM2350 is a novel bioinformatically detectable regulatory, non protein coding,

CCATCCTGCC micro RNA (miRNA)-like oligonucleotide. The method by which GAM2350 was detected is

TCCACCACTT described with additional reference to Figs. 9-15.

CCTGTTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM2350 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2350

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2350

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2350 precursor RNA is designated SEQ ID:5647, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5647 is located from position 47322081 to position 47322157 relative to chromosome 11 on the `+` strand.

GAM2350 precursor RNA folds onto itself, forming GAM2350 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2350 precursor RNA, designated SEQ ID NO: 5647, and a schematic representation of a predicted secondary folding of GAM2350 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2350 folded precursor RNA yielding a GAM2350 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM2350 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2350 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM2350 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2350 target RNA, herein designated GAM TARGET RNA. GAM2350 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2350 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2350 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2350 RNA is a partial or fully complementary sequence of the

nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2350 RNA, herein designated GAM RNA, to target binding sites on GAM2350 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2350 target RNA into GAM2350 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2350 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2350 target genes. The mRNA of each one of this plurality of GAM2350 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2350 RNA, herein designated GAM RNA, and which when bound by GAM2350 RNA causes inhibition of translation of the GAM2350 target mRNA into a corresponding GAM2350 target protein.

The mechanism of the translational inhibition exerted by GAM2350 RNA, herein designated GAM RNA, on one or more GAM2350 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2350 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2350 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2350 RNA, herein designated GAM RNA, of GAM2350 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2350 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2350 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2350 RNA correlate with, and may be deduced from, the identity of the GAM2350 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2384 7017 TCATTCCTCT Fig. 8 further provides a conceptual description of another novel bioinformatically

TAATCTTCAC detected oligonucleotides of the present invention, referred to here as Genomic Address
TAAAATGGAC Messenger 2384 (GAM2384) oligonucleotides modulates expression of respective target genes
AAGTATTCAT whose function and utility is known in the art.

TGAGCACCTA GAM2384 is a novel bioinformatically detectable regulatory, non protein coding,
ATGCGTGTTC micro RNA (miRNA)-like oligonucleotide. The method by which GAM2384 was detected is

AGTATGGTGG described with additional reference to Figs. 9-15.

GAGATGAGGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ATGA encoded by the human genome.

GAM2384 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2384

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2384

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2384 precursor RNA is designated SEQ ID:7017, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7017 is located from position 35442640 to position 35442723 relative to chromosome 7 on the `+` strand.

GAM2384 precursor RNA folds onto itself, forming GAM2384 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2384 precursor RNA, designated SEQ ID NO: 7017, and a schematic representation of a predicted secondary folding of GAM2384 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2384 folded precursor RNA yielding a GAM2384 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM2384 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2384 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM2384 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2384 target RNA, herein designated GAM TARGET RNA. GAM2384 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

GAM2384 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2384 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2384 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2384 RNA, herein designated GAM RNA, to target binding sites on GAM2384 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2384 target RNA into GAM2384 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2384 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2384 target genes. The mRNA of each one of this plurality of GAM2384 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2384 RNA, herein designated GAM RNA, and which when bound by GAM2384 RNA causes inhibition of translation of the GAM2384 target mRNA into a corresponding GAM2384 target protein.

The mechanism of the translational inhibition exerted by GAM2384 RNA, herein designated GAM RNA, on one or more GAM2384 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2384 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2384 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2384 RNA, herein designated GAM RNA, of GAM2384 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2384 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2384 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2384 RNA

correlate with, and may be deduced from, the identity of the GAM2384 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

ATGAAGCCAC detected oligonucleotides of the present invention, referred to here as Genomic Address
AGAGATTTGC Messenger 2393 (GAM2393) oligonucleotides modulates expression of respective target genes
TGATACATTT whose function and utility is known in the art.

GCTAGGCACG GAM2393 is a novel bioinformatically detectable regulatory, non protein coding,
ACTTCTGGTC micro RNA (miRNA)-like oligonucleotide. The method by which GAM2393 was detected is

ATTTAGAAAG described with additional reference to Figs. 9-15.

CTATTTTGTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GCTTCATCAA encoded by the human genome.

TAAGGTATTC GAM2393 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2393
CCCAGCT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2393
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2393 precursor RNA is designated SEQ ID:5830, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5830 is located from position 99981233 to position 99981339 relative to chromosome 3 on the `+` strand.

GAM2393 precursor RNA folds onto itself, forming GAM2393 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2393 precursor RNA, designated SEQ ID NO: 5830, and a schematic representation of a predicted secondary folding of GAM2393 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2393 folded precursor RNA yielding a GAM2393 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2393 RNA, hereby incorporated herein.

GAM2393 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2393 target RNA, herein designated GAM TARGET RNA. GAM2393 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2393 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2393 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2393 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2393 RNA, herein designated GAM RNA, to target binding sites on GAM2393 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2393 target RNA into GAM2393 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2393 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2393 target genes. The mRNA of each one of this plurality of GAM2393 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2393 RNA, herein designated GAM RNA, and which when bound by GAM2393 RNA causes inhibition of translation of the GAM2393 target mRNA into a corresponding GAM2393 target protein.

The mechanism of the translational inhibition exerted by GAM2393 RNA, herein designated GAM RNA, on one or more GAM2393 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2393 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2393 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2393 RNA, herein designated GAM RNA, of

GAM2393 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2393 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2393 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2393 RNA correlate with, and may be deduced from, the identity of the GAM2393 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2398 5666 AAGCCCTTGA Fig. 8 further provides a conceptual description of another novel bioinformatically

CTGGGGCTGC detected oligonucleotides of the present invention, referred to here as Genomic Address

TGCCTTTCTC Messenger 2398 (GAM2398) oligonucleotides modulates expression of respective target genes

TCAGAGATGC whose function and utility is known in the art.

CCTGCCCAGT GAM2398 is a novel bioinformatically detectable regulatory, non protein coding,

GAGGAGGAAT micro RNA (miRNA)-like oligonucleotide. The method by which GAM2398 was detected is

CTAGAGAGGC described with additional reference to Figs. 9-15.

AGTCTGGCCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAGTTGCTT encoded by the human genome.

GAM2398 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2398

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2398

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2398 precursor RNA is designated SEQ ID:5666, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5666 is located from position 63185944 to position 63186032 relative to chromosome 11 on the `-` strand.

GAM2398 precursor RNA folds onto itself, forming GAM2398 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2398 precursor RNA, designated SEQ ID NO: 5666, and a schematic representation of a predicted secondary folding of GAM2398 folded precursor RNA,

herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2398 folded precursor RNA yielding a GAM2398 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM2398 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2398 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM2398 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2398 target RNA, herein designated GAM TARGET RNA. GAM2398 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2398 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2398 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2398 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2398 RNA, herein designated GAM RNA, to target binding sites on GAM2398 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2398 target RNA into GAM2398 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2398 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2398 target genes. The mRNA of each one of this plurality of GAM2398 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2398 RNA, herein designated GAM RNA, and which when bound by GAM2398 RNA causes inhibition of translation of the GAM2398 target mRNA into a corresponding GAM2398 target protein.

The mechanism of the translational inhibition exerted by GAM2398 RNA, herein designated GAM RNA, on one or more GAM2398 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2398 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2398 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2398 RNA, herein designated GAM RNA, of GAM2398 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2398 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2398 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2398 RNA correlate with, and may be deduced from, the identity of the GAM2398 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2424 7052 TCGCTTGAAC Fig. 8 further provides a conceptual description of another novel bioinformatically

CCGGGAGGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGTAGTAG Messenger 2424 (GAM2424) oligonucleotides modulates expression of respective target genes

TGAGCTGAAG whose function and utility is known in the art.

TCCCGCCACT GAM2424 is a novel bioinformatically detectable regulatory, non protein coding,

GCACTCCAGC micro RNA (miRNA)-like oligonucleotide. The method by which GAM2424 was detected is

CTGGGCAACA described with additional reference to Figs. 9-15.

GAGCGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM2424 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2424

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2424

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2424 precursor RNA is designated SEQ ID:7052, and is provided hereinbelow with reference to the sequence listing part.

GAM2424 precursor RNA folds onto itself, forming GAM2424 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of

the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2424 precursor RNA, designated SEQ ID NO: 7052, and a schematic representation of a predicted secondary folding of GAM2424 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2424 folded precursor RNA yielding a GAM2424 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2424 RNA, hereby incorporated herein. Expression of GAM2424 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM2424 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2424 target RNA, herein designated GAM TARGET RNA. GAM2424 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2424 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2424 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2424 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2424 RNA, herein designated GAM RNA, to target binding sites on GAM2424 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2424 target RNA into GAM2424 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2424 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2424 target genes. The mRNA of each one of this plurality of GAM2424 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2424 RNA, herein designated GAM RNA, and which when bound by GAM2424 RNA causes inhibition of translation of the GAM2424 target mRNA into a corresponding GAM2424 target protein.

The mechanism of the translational inhibition exerted by GAM2424 RNA, herein

designated GAM RNA, on one or more GAM2424 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2424 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2424 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2424 RNA, herein designated GAM RNA, of GAM2424 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2424 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2424 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2424 RNA correlate with, and may be deduced from, the identity of the GAM2424 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2440 7311 TTGCTTGAAC Fig. 8 further provides a conceptual description of another novel bioinformatically

CCAAGAGGCG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGTTGCAG Messenger 2440 (GAM2440) oligonucleotides modulates expression of respective target genes

TGAGCTAAGA whose function and utility is known in the art.

TCATGCCACT GAM2440 is a novel bioinformatically detectable regulatory, non protein coding,

GCACTCCAGC micro RNA (miRNA)-like oligonucleotide. The method by which GAM2440 was detected is

CTGGGTGACA described with additional reference to Figs. 9-15.

GAGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM2440 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2440

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2440

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2440 precursor RNA is designated SEQ ID:7311, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7311 is located from position 29072015 to position 29072090 relative to chromosome 14

on the `+` strand.

GAM2440 precursor RNA folds onto itself, forming GAM2440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2440 precursor RNA, designated SEQ ID NO: 7311, and a schematic representation of a predicted secondary folding of GAM2440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2440 folded precursor RNA yielding a GAM2440 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2440 RNA, hereby incorporated herein.

GAM2440 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2440 target RNA, herein designated GAM TARGET RNA. GAM2440 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2440 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2440 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2440 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2440 RNA, herein designated GAM RNA, to target binding sites on GAM2440 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2440 target RNA into GAM2440 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2440 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2440 target genes. The mRNA of each one of this plurality of GAM2440 target genes comprises one or more target binding sites, each having

a nucleotide sequence which is at least partly complementary to GAM2440 RNA, herein designated GAM RNA, and which when bound by GAM2440 RNA causes inhibition of translation of the GAM2440 target mRNA into a corresponding GAM2440 target protein.

The mechanism of the translational inhibition exerted by GAM2440 RNA, herein designated GAM RNA, on one or more GAM2440 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2440 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2440 RNA, herein designated GAM RNA, of GAM2440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2440 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2440 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2440 RNA correlate with, and may be deduced from, the identity of the GAM2440 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2514 7214 TGGAACTGGA Fig. 8 further provides a conceptual description of another novel bioinformatically
GGAGCTGTCC detected oligonucleotides of the present invention, referred to here as Genomic Address
TGTGTCAGCC Messenger 2514 (GAM2514) oligonucleotides modulates expression of respective target genes
TGAAATAATC whose function and utility is known in the art.

AAAAGGATCA GAM2514 is a novel bioinformatically detectable regulatory, non protein coding,
AAAATCCTGT micro RNA (miRNA)-like oligonucleotide. The method by which GAM2514 was detected is

TTTAGGCAAC described with additional reference to Figs. 9-15.

ATAGGAAGAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TCCAACTCTA encoded by the human genome.

GAM2514 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2514

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2514

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2514 precursor RNA is designated SEQ ID:7214, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7214 is located from position 93198982 to position 93199071 relative to chromosome 1 on the `+` strand.

GAM2514 precursor RNA folds onto itself, forming GAM2514 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2514 precursor RNA, designated SEQ ID NO: 7214, and a schematic representation of a predicted secondary folding of GAM2514 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2514 folded precursor RNA yielding a GAM2514 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM2514 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2514 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM2514 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2514 target RNA, herein designated GAM TARGET RNA. GAM2514 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2514 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2514 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2514 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2514 RNA, herein designated GAM RNA, to target binding sites on GAM2514 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2514 target RNA into GAM2514 target protein, herein designated GAM TARGET PROTEIN,, which is shown

surrounded by a broken line.

It is appreciated that GAM2514 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2514 target genes. The mRNA of each one of this plurality of GAM2514 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2514 RNA, herein designated GAM RNA, and which when bound by GAM2514 RNA causes inhibition of translation of the GAM2514 target mRNA into a corresponding GAM2514 target protein.

The mechanism of the translational inhibition exerted by GAM2514 RNA, herein designated GAM RNA, on one or more GAM2514 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2514 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2514 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2514 RNA, herein designated GAM RNA, of GAM2514 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2514 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2514 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2514 RNA correlate with, and may be deduced from, the identity of the GAM2514 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2519 5968 ATGATGCCAG Fig. 8 further provides a conceptual description of another novel bioinformatically

GACTGCAGCT detected oligonucleotides of the present invention, referred to here as Genomic Address

TCAGGGACTT Messenger 2519 (GAM2519) oligonucleotides modulates expression of respective target genes

GTGGCAGATG whose function and utility is known in the art.

CACAGGGTGC GAM2519 is a novel bioinformatically detectable regulatory, non protein coding,

CTCTGGCTCC micro RNA (miRNA)-like oligonucleotide. The method by which GAM2519 was detected is

CTGGAGCTCC described with additional reference to Figs. 9-15.

ACACTGCAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CCCAGCTCTG encoded by the human genome.

T GAM2519 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2519 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2519 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2519 precursor RNA is designated SEQ ID:5968, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5968 is located from position 80675207 to position 80675297 relative to chromosome 10 on the `+` strand.

GAM2519 precursor RNA folds onto itself, forming GAM2519 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2519 precursor RNA, designated SEQ ID NO: 5968, and a schematic representation of a predicted secondary folding of GAM2519 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2519 folded precursor RNA yielding a GAM2519 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2519 RNA, hereby incorporated herein.

GAM2519 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2519 target RNA, herein designated GAM TARGET RNA. GAM2519 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2519 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2519 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2519 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2519 RNA, herein designated GAM RNA, to target binding sites on GAM2519 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2519 target RNA into GAM2519 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2519 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2519 target genes. The mRNA of each one of this plurality of GAM2519 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2519 RNA, herein designated GAM RNA, and which when bound by GAM2519 RNA causes inhibition of translation of the GAM2519 target mRNA into a corresponding GAM2519 target protein.

The mechanism of the translational inhibition exerted by GAM2519 RNA, herein designated GAM RNA, on one or more GAM2519 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2519 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2519 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2519 RNA, herein designated GAM RNA, of GAM2519 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2519 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2519 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2519 RNA correlate with, and may be deduced from, the identity of the GAM2519 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2543 7207 TGCTGTAGGC Fig. 8 further provides a conceptual description of another novel bioinformatically
TGTATGCTGT detected oligonucleotides of the present invention, referred to here as Genomic Address
TAATGCTAAT Messenger 2543 (GAM2543) oligonucleotides modulates expression of respective target genes
CGTGATAGGG whose function and utility is known in the art.

GTTTTTGCCT GAM2543 is a novel bioinformatically detectable regulatory, non protein coding,
CCAACTGACT micro RNA (miRNA)-like oligonucleotide. The method by which GAM2543 was detected is

CCTACATATT described with additional reference to Figs. 9-15.

AGCATTAACA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GTGTATGATG encoded by the human genome.

CCTGTTACTA GAM2543 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2543

GCA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2543

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2543 precursor RNA is designated SEQ ID:7207, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7207 is located from position 25868146 to position 25868248 relative to chromosome 21 on the `+` strand.

GAM2543 precursor RNA folds onto itself, forming GAM2543 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2543 precursor RNA, designated SEQ ID NO: 7207, and a schematic representation of a predicted secondary folding of GAM2543 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2543 folded precursor RNA yielding a GAM2543 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2543 RNA, hereby incorporated herein.

GAM2543 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2543 target RNA, herein designated GAM TARGET RNA. GAM2543 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2543 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2543 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2543 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2543 RNA, herein designated GAM RNA, to target binding sites on GAM2543 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2543 target RNA into GAM2543 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2543 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2543 target genes. The mRNA of each one of this plurality of GAM2543 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2543 RNA, herein designated GAM RNA, and which when bound by GAM2543 RNA causes inhibition of translation of the GAM2543 target mRNA into a corresponding GAM2543 target protein.

The mechanism of the translational inhibition exerted by GAM2543 RNA, herein designated GAM RNA, on one or more GAM2543 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2543 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2543 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2543 RNA, herein designated GAM RNA, of GAM2543 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2543 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2543 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2543 RNA correlate with, and may be deduced from, the identity of the GAM2543 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2565 6361 GAGCCTTTTA ATGACACAGT GGGGCCAGTT Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 2565 (GAM2565) oligonucleotides modulates expression of respective target genes

GGAGCACTGA whose function and utility is known in the art.

TCCTGGTCAT GAM2565 is a novel bioinformatically detectable regulatory, non protein coding,
TACTCCTGCA micro RNA (miRNA)-like oligonucleotide. The method by which GAM2565 was detected is

CCCTGGCCTG described with additional reference to Figs. 9-15.

CAGCCTTCCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CTCAGTGTCT encoded by the human genome.

TATTTGGGCT GAM2565 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2565
T precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2565
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2565 precursor RNA is designated SEQ ID:6361, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6361 is located from position 17811037 to position 17811137 relative to chromosome 22 on the `-` strand.

GAM2565 precursor RNA folds onto itself, forming GAM2565 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2565 precursor RNA, designated SEQ ID NO: 6361, and a schematic representation of a predicted secondary folding of GAM2565 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2565 folded precursor RNA yielding a GAM2565 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2565 RNA, hereby incorporated herein.

GAM2565 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2565 target RNA, herein designated GAM TARGET RNA. GAM2565 target RNA
comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2565 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2565 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2565 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2565 RNA, herein designated GAM RNA, to target binding sites on GAM2565 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2565 target RNA into GAM2565 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2565 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2565 target genes. The mRNA of each one of this plurality of GAM2565 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2565 RNA, herein designated GAM RNA, and which when bound by GAM2565 RNA causes inhibition of translation of the GAM2565 target mRNA into a corresponding GAM2565 target protein.

The mechanism of the translational inhibition exerted by GAM2565 RNA, herein designated GAM RNA, on one or more GAM2565 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2565 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2565 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2565 RNA, herein designated GAM RNA, of GAM2565 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2565 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2565 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2565 RNA correlate with, and may be deduced from, the identity of the GAM2565 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2591 6099 CCGGTAGGTT Fig. 8 further provides a conceptual description of another novel bioinformatically

TAGAATGAGG detected oligonucleotides of the present invention, referred to here as Genomic Address

TCTGTGTCAC Messenger 2591 (GAM2591) oligonucleotides modulates expression of respective target genes

TGTGGTATTA whose function and utility is known in the art.

CGATATTTTG GAM2591 is a novel bioinformatically detectable regulatory, non protein coding,

ACTGGTTATT micro RNA (miRNA)-like oligonucleotide. The method by which GAM2591 was detected is

ATAACCACAG described with additional reference to Figs. 9-15.

TGTCACAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TCCATCAAAA encoded by the human genome.

ACCCATGCCT GAM2591 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2591

GG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2591

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2591 precursor RNA is designated SEQ ID:6099, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6099 is located from position 104342178 to position 104342279 relative to chromosome 14 on the `-` strand.

GAM2591 precursor RNA folds onto itself, forming GAM2591 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2591 precursor RNA, designated SEQ ID NO: 6099, and a schematic representation of a predicted secondary folding of GAM2591 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2591 folded precursor RNA yielding a GAM2591 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2591 RNA, hereby incorporated herein.

GAM2591 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2591 target RNA, herein designated GAM TARGET RNA. GAM2591 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated

region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2591 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2591 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2591 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2591 RNA, herein designated GAM RNA, to target binding sites on GAM2591 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2591 target RNA into GAM2591 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2591 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2591 target genes. The mRNA of each one of this plurality of GAM2591 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2591 RNA, herein designated GAM RNA, and which when bound by GAM2591 RNA causes inhibition of translation of the GAM2591 target mRNA into a corresponding GAM2591 target protein.

The mechanism of the translational inhibition exerted by GAM2591 RNA, herein designated GAM RNA, on one or more GAM2591 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2591 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2591 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2591 RNA, herein designated GAM RNA, of GAM2591 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2591 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2591 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2591 RNA correlate with, and may be deduced from, the identity of the GAM2591 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2608 6276 CTTTTGAGCT Fig. 8 further provides a conceptual description of another novel bioinformatically

ATGTGTCTCT Messenger 2608 (GAM2608) oligonucleotides modulates expression of respective target genes
TGTGTTAAGG whose function and utility is known in the art.

TGCATCTAGT GAM2608 is a novel bioinformatically detectable regulatory, non protein coding,
GCAGTTAGTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM2608 was detected is

AAGCAGCTTA described with additional reference to Figs. 9-15.

GAATCTACTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CCCTAAATGC encoded by the human genome.

CCCTTCTGGC GAM2608 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2608
ACAGGCTGCC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2608
TAATATACAG precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar
CATTTTAAAA to the nucleotide sequence of GAM2608 precursor RNA is designated SEQ ID:6276, and is

G provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6276 is located from position 131249037 to position 131249167 relative to chromosome X on the `-` strand.

GAM2608 precursor RNA folds onto itself, forming GAM2608 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2608 precursor RNA, designated SEQ ID NO: 6276, and a schematic representation of a predicted secondary folding of GAM2608 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2608 folded precursor RNA yielding a GAM2608 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the

nucleotide sequence of GAM2608 RNA, hereby incorporated herein. Expression of GAM2608 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM2608 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2608 target RNA, herein designated GAM TARGET RNA. GAM2608 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2608 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2608 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2608 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2608 RNA, herein designated GAM RNA, to target binding sites on GAM2608 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2608 target RNA into GAM2608 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2608 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2608 target genes. The mRNA of each one of this plurality of GAM2608 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2608 RNA, herein designated GAM RNA, and which when bound by GAM2608 RNA causes inhibition of translation of the GAM2608 target mRNA into a corresponding GAM2608 target protein.

The mechanism of the translational inhibition exerted by GAM2608 RNA, herein designated GAM RNA, on one or more GAM2608 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2608 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2608 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2608 RNA, herein designated GAM RNA, of GAM2608 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2608 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2608 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2608 RNA correlate with, and may be deduced from, the identity of the GAM2608 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2618 7275 TGTGGGAAGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GCCCTGGAGG whose function and utility is known in the art.

CAAAGGGCCT GAM2618 is a novel bioinformatically detectable regulatory, non protein coding,
GCCTCGACCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM2618 was detected is

TGCCCCCCAT described with additional reference to Figs. 9-15.

AACCCACA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM2618 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2618

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2618
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2618 precursor RNA is designated SEQ ID:7275, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7275 is located from position 10351230 to position 10351307 relative to chromosome 19 on the `+` strand.

GAM2618 precursor RNA folds onto itself, forming GAM2618 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2618 precursor RNA, designated SEQ ID NO: 7275, and a schematic representation of a predicted secondary folding of GAM2618 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2618 folded precursor RNA yielding a GAM2618 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2618 RNA, hereby incorporated herein.

GAM2618 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2618 target RNA, herein designated GAM TARGET RNA. GAM2618 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2618 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2618 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2618 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2618 RNA, herein designated GAM RNA, to target binding sites on GAM2618 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2618 target RNA into GAM2618 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2618 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2618 target genes. The mRNA of each one of this plurality of GAM2618 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2618 RNA, herein designated GAM RNA, and which when bound by GAM2618 RNA causes inhibition of translation of the GAM2618 target mRNA into a corresponding GAM2618 target protein.

The mechanism of the translational inhibition exerted by GAM2618 RNA, herein designated GAM RNA, on one or more GAM2618 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2618 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2618 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2618 RNA, herein designated GAM RNA, of GAM2618 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2618 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2618 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2618 RNA correlate with, and may be deduced from, the identity of the GAM2618 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2624 5958 ATCGTCTGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

CCCAGGAGTT detected oligonucleotides of the present invention, referred to here as Genomic Address

TGAGGCTGCA Messenger 2624 (GAM2624) oligonucleotides modulates expression of respective target genes

GTGAGCTACA whose function and utility is known in the art.

ATCACACCCC GAM2624 is a novel bioinformatically detectable regulatory, non protein coding,

TGCACTCAAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM2624 was detected is

CCTGGGTTAC described with additional reference to Figs. 9-15.

AGAGTGAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM2624 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2624

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2624

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2624 precursor RNA is designated SEQ ID:5958, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5958 is located from position 128731509 to position 128731586 relative to chromosome X on the `-` strand.

GAM2624 precursor RNA folds onto itself, forming GAM2624 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2624 precursor RNA, designated SEQ ID NO: 5958, and a schematic representation of a predicted secondary folding of GAM2624 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2624 folded precursor RNA yielding a GAM2624 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM2624 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2624 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM2624 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2624 target RNA, herein designated GAM TARGET RNA. GAM2624 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2624 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2624 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2624 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2624 RNA, herein designated GAM RNA, to target binding sites on GAM2624 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2624 target RNA into GAM2624 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2624 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2624 target genes. The mRNA of each one of this plurality of GAM2624 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2624 RNA, herein designated GAM RNA, and which when bound by GAM2624 RNA causes inhibition of translation of the GAM2624 target mRNA into a corresponding GAM2624 target protein.

The mechanism of the translational inhibition exerted by GAM2624 RNA, herein designated GAM RNA, on one or more GAM2624 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational

inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2624 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2624 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2624 RNA, herein designated GAM RNA, of GAM2624 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2624 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2624 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2624 RNA correlate with, and may be deduced from, the identity of the GAM2624 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2628 6901 GTGCACTACA Fig. 8 further provides a conceptual description of another novel bioinformatically

GACTCCAGCC detected oligonucleotides of the present invention, referred to here as Genomic Address

TCCCTTTGAA Messenger 2628 (GAM2628) oligonucleotides modulates expression of respective target genes

GCCAGGTTCC whose function and utility is known in the art.

AGAGCTTCCT GAM2628 is a novel bioinformatically detectable regulatory, non protein coding,

CCCTTTGGCC micro RNA (miRNA)-like oligonucleotide. The method by which GAM2628 was detected is

TGGAACCTCA described with additional reference to Figs. 9-15.

ACAGCAGGAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGGGATGAGG encoded by the human genome.

ATGGAAGTGT GAM2628 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2628

AC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2628

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2628 precursor RNA is designated SEQ ID:6901, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6901 is located from position 15653139 to position 15653240 relative to chromosome 17 on the `-` strand.

GAM2628 precursor RNA folds onto itself, forming GAM2628 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2628 precursor RNA, designated SEQ ID NO: 6901, and a schematic representation of a predicted secondary folding of GAM2628 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2628 folded precursor RNA yielding a GAM2628 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2628 RNA, hereby incorporated herein.

GAM2628 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2628 target RNA, herein designated GAM TARGET RNA. GAM2628 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2628 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2628 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2628 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2628 RNA, herein designated GAM RNA, to target binding sites on GAM2628 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2628 target RNA into GAM2628 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2628 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2628 target genes. The mRNA of each one of this plurality of GAM2628 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2628 RNA, herein designated GAM RNA, and which when bound by GAM2628 RNA causes inhibition of translation

of the GAM2628 target mRNA into a corresponding GAM2628 target protein.

The mechanism of the translational inhibition exerted by GAM2628 RNA, herein designated GAM RNA, on one or more GAM2628 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2628 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2628 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2628 RNA, herein designated GAM RNA, of GAM2628 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2628 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2628 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2628 RNA correlate with, and may be deduced from, the identity of the GAM2628 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2631 7210 TGCTTCCTTA Fig. 8 further provides a conceptual description of another novel bioinformatically
CCTACAAGAA detected oligonucleotides of the present invention, referred to here as Genomic Address
AATTTAGAAG Messenger 2631 (GAM2631) oligonucleotides modulates expression of respective target genes
TTGGTGCAAA whose function and utility is known in the art.

TGGCATTTCC GAM2631 is a novel bioinformatically detectable regulatory, non protein coding,
ATGAGTACTT micro RNA (miRNA)-like oligonucleotide. The method by which GAM2631 was detected is

CTCATGCATC described with additional reference to Figs. 9-15.

TTTGCATATT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TCACCTGGGG encoded by the human genome.

GGAAGCA GAM2631 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2631
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2631
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of GAM2631 precursor RNA is designated SEQ ID:7210, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7210 is located from position 8927224 to position 8927320 relative to chromosome 8 on the `+` strand.

GAM2631 precursor RNA folds onto itself, forming GAM2631 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2631 precursor RNA, designated SEQ ID NO: 7210, and a schematic representation of a predicted secondary folding of GAM2631 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2631 folded precursor RNA yielding a GAM2631 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2631 RNA, hereby incorporated herein.

GAM2631 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2631 target RNA, herein designated GAM TARGET RNA. GAM2631 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2631 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2631 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2631 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2631 RNA, herein designated GAM RNA, to target binding sites on GAM2631 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2631 target RNA into GAM2631 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2631 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2631 target genes. The mRNA of each one of this plurality of GAM2631 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2631 RNA, herein designated GAM RNA, and which when bound by GAM2631 RNA causes inhibition of translation of the GAM2631 target mRNA into a corresponding GAM2631 target protein.

The mechanism of the translational inhibition exerted by GAM2631 RNA, herein designated GAM RNA, on one or more GAM2631 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2631 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2631 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2631 RNA, herein designated GAM RNA, of GAM2631 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2631 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2631 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2631 RNA correlate with, and may be deduced from, the identity of the GAM2631 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TTGCAGGGAT Messenger 2732 (GAM2732) oligonucleotides modulates expression of respective target genes
TACTAATGGT whose function and utility is known in the art.

GGGGCAGCAG GAM2732 is a novel bioinformatically detectable regulatory, non protein coding, GTCTGTGAAT micro RNA (miRNA)-like oligonucleotide. The method by which GAM2732 was detected is

TAAGTTATCT described with additional reference to Figs. 9-15.

CTTGACCTCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CCCTCATGTC encoded by the human genome.

AACACAAATG GAM2732 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2732

TAATTCCTAA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2732

ACAAGATGCA precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar TTGCCAGTCT to the nucleotide sequence of GAM2732 precursor RNA is designated SEQ ID:6840, and is

provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6840 is located from position 49257580 to position 49257709 relative to chromosome 7 on the `-` strand.

GAM2732 precursor RNA folds onto itself, forming GAM2732 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2732 precursor RNA, designated SEQ ID NO: 6840, and a schematic representation of a predicted secondary folding of GAM2732 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2732 folded precursor RNA yielding a GAM2732 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2732 RNA, hereby incorporated herein.

GAM2732 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2732 target RNA, herein designated GAM TARGET RNA. GAM2732 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2732 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2732 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2732 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2732 RNA, herein designated GAM RNA, to target binding sites on GAM2732 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2732 target RNA into GAM2732 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2732 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2732 target genes. The mRNA of each one of this plurality of GAM2732 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2732 RNA, herein designated GAM RNA, and which when bound by GAM2732 RNA causes inhibition of translation of the GAM2732 target mRNA into a corresponding GAM2732 target protein.

The mechanism of the translational inhibition exerted by GAM2732 RNA, herein designated GAM RNA, on one or more GAM2732 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2732 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2732 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2732 RNA, herein designated GAM RNA, of GAM2732 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2732 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2732 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2732 RNA correlate with, and may be deduced from, the identity of the GAM2732 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2762 6255 CTTCTCACTT Fig. 8 further provides a conceptual description of another novel bioinformatically
TCCCTTCACA detected oligonucleotides of the present invention, referred to here as Genomic Address
CACAGTCGTG Messenger 2762 (GAM2762) oligonucleotides modulates expression of respective target genes
TAGTTTTGCG whose function and utility is known in the art.

CTTGCTTGAT GAM2762 is a novel bioinformatically detectable regulatory, non protein coding,
TAATCTCTTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM2762 was detected is

GCCTCAGTCG described with additional reference to Figs. 9-15.

GTTTTCTACC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ATATGGAGTT encoded by the human genome.

GGTTCATTCT GAM2762 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2762
CTCGAATGGC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2762
TGTGTAGTCC precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar
AGTGTGTGGG to the nucleotide sequence of GAM2762 precursor RNA is designated SEQ ID:6255, and is

provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6255 is located from position 110144402 to position 110144531 relative to chromosome 13 on the `-` strand.

GAM2762 precursor RNA folds onto itself, forming GAM2762 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2762 precursor RNA, designated SEQ ID NO: 6255, and a schematic representation of a predicted secondary folding of GAM2762 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2762 folded precursor RNA yielding a GAM2762 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2762 RNA, hereby incorporated herein.

GAM2762 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2762 target RNA, herein designated GAM TARGET RNA. GAM2762 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2762 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2762 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2762 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2762 RNA, herein designated GAM RNA, to target binding sites on GAM2762 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2762 target RNA into GAM2762 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2762 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2762 target genes. The mRNA of each one of this plurality of GAM2762 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2762 RNA, herein designated GAM RNA, and which when bound by GAM2762 RNA causes inhibition of translation of the GAM2762 target mRNA into a corresponding GAM2762 target protein.

The mechanism of the translational inhibition exerted by GAM2762 RNA, herein designated GAM RNA, on one or more GAM2762 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2762 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2762 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2762 RNA, herein designated GAM RNA, of GAM2762 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2762 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2762 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2762 RNA correlate with, and may be deduced from, the identity of the GAM2762 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2770 6592 GGACTACAGG Fig. 8 further provides a conceptual description of another novel bioinformatically

CACATGCAAC detected oligonucleotides of the present invention, referred to here as Genomic Address

CACATCTGGC Messenger 2770 (GAM2770) oligonucleotides modulates expression of respective target genes

TAATTTTCTT whose function and utility is known in the art.

GAGTTTTAGT GAM2770 is a novel bioinformatically detectable regulatory, non protein coding,

AGAGACTGGG micro RNA (miRNA)-like oligonucleotide. The method by which GAM2770 was detected is

TCTCATTATG described with additional reference to Figs. 9-15.

TTGTCCAGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGGTCCCAAG encoded by the human genome.

CTCCTGAGTT GAM2770 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2770

C precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2770

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2770 precursor RNA is designated SEQ ID:6592, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6592 is located from position 69984108 to position 69984208 relative to chromosome 16 on the `-` strand.

GAM2770 precursor RNA folds onto itself, forming GAM2770 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2770 precursor RNA, designated SEQ ID NO: 6592, and a schematic representation of a predicted secondary folding of GAM2770 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2770 folded precursor RNA yielding a GAM2770 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the

nucleotide sequence of GAM2770 RNA, hereby incorporated herein.

GAM2770 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2770 target RNA, herein designated GAM TARGET RNA. GAM2770 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2770 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2770 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2770 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2770 RNA, herein designated GAM RNA, to target binding sites on GAM2770 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2770 target RNA into GAM2770 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2770 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2770 target genes. The mRNA of each one of this plurality of GAM2770 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2770 RNA, herein designated GAM RNA, and which when bound by GAM2770 RNA causes inhibition of translation of the GAM2770 target mRNA into a corresponding GAM2770 target protein.

The mechanism of the translational inhibition exerted by GAM2770 RNA, herein designated GAM RNA, on one or more GAM2770 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2770 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2770 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2770 RNA, herein designated GAM RNA, of GAM2770 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2770 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2770 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2770 RNA correlate with, and may be deduced from, the identity of the GAM2770 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2780 6229 CTGGGAGGCA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAGGTTGCAG detected oligonucleotides of the present invention, referred to here as Genomic Address

TGATCAGGAA Messenger 2780 (GAM2780) oligonucleotides modulates expression of respective target genes

TTGTGCCACT whose function and utility is known in the art.

GCACTCCAAC GAM2780 is a novel bioinformatically detectable regulatory, non protein coding,

CTGAGTGACA micro RNA (miRNA)-like oligonucleotide. The method by which GAM2780 was detected is

GAGCAACACT described with additional reference to Figs. 9-15.

CTGTCTTAAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AG encoded by the human genome.

GAM2780 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2780

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2780

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2780 precursor RNA is designated SEQ ID:6229, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6229 is located from position 101905422 to position 101905503 relative to chromosome 11 on the `+` strand.

GAM2780 precursor RNA folds onto itself, forming GAM2780 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2780 precursor RNA, designated SEQ ID NO: 6229, and a schematic representation of a predicted secondary folding of GAM2780 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2780 folded precursor RNA

yielding a GAM2780 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2780 RNA, hereby incorporated herein.

GAM2780 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2780 target RNA, herein designated GAM TARGET RNA. GAM2780 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2780 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2780 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2780 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2780 RNA, herein designated GAM RNA, to target binding sites on GAM2780 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2780 target RNA into GAM2780 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2780 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2780 target genes. The mRNA of each one of this plurality of GAM2780 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2780 RNA, herein designated GAM RNA, and which when bound by GAM2780 RNA causes inhibition of translation of the GAM2780 target mRNA into a corresponding GAM2780 target protein.

The mechanism of the translational inhibition exerted by GAM2780 RNA, herein designated GAM RNA, on one or more GAM2780 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2780 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2780 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2780 RNA, herein designated GAM RNA, of GAM2780 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2780 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2780 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2780 RNA correlate with, and may be deduced from, the identity of the GAM2780 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2799 5809 AGTCTCACTC Fig. 8 further provides a conceptual description of another novel bioinformatically

TGTTGCCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GCTGGAGTGC Messenger 2799 (GAM2799) oligonucleotides modulates expression of respective target genes

AGTGGTGCGA whose function and utility is known in the art.

TCTCAGCTCA GAM2799 is a novel bioinformatically detectable regulatory, non protein coding,

CTGCAACCTC micro RNA (miRNA)-like oligonucleotide. The method by which GAM2799 was detected is

CACCTCCTGG described with additional reference to Figs. 9-15.

GTTCAAGTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTCT encoded by the human genome.

GAM2799 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2799

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2799

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2799 precursor RNA is designated SEQ ID:5809, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5809 is located from position 67595564 to position 67595647 relative to chromosome 17 on the `+` strand.

GAM2799 precursor RNA folds onto itself, forming GAM2799 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2799 precursor RNA, designated SEQ ID NO: 5809, and a

schematic representation of a predicted secondary folding of GAM2799 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2799 folded precursor RNA yielding a GAM2799 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM2799 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2799 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM2799 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2799 target RNA, herein designated GAM TARGET RNA. GAM2799 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2799 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2799 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2799 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2799 RNA, herein designated GAM RNA, to target binding sites on GAM2799 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2799 target RNA into GAM2799 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2799 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2799 target genes. The mRNA of each one of this plurality of GAM2799 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2799 RNA, herein designated GAM RNA, and which when bound by GAM2799 RNA causes inhibition of translation of the GAM2799 target mRNA into a corresponding GAM2799 target protein.

The mechanism of the translational inhibition exerted by GAM2799 RNA, herein designated GAM RNA, on one or more GAM2799 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2799 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2799 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2799 RNA, herein designated GAM RNA, of GAM2799 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2799 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2799 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2799 RNA correlate with, and may be deduced from, the identity of the GAM2799 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2807 5981 ATTGTATTGC Fig. 8 further provides a conceptual description of another novel bioinformatically

AGCAGGTTGG detected oligonucleotides of the present invention, referred to here as Genomic Address

CAGCCTCAGT Messenger 2807 (GAM2807) oligonucleotides modulates expression of respective target genes

AAATCTCCAT whose function and utility is known in the art.

TTGTAAATGT GAM2807 is a novel bioinformatically detectable regulatory, non protein coding,

GACAGTCAGC micro RNA (miRNA)-like oligonucleotide. The method by which GAM2807 was detected is

AGAATCTCCA described with additional reference to Figs. 9-15.

GTTACAGTCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACTCAAAGCA encoded by the human genome.

AGCAGGGGCA GAM2807 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2807

TGCCACATAC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2807

ATGTTCATAT precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar

ATAGT to the nucleotide sequence of GAM2807 precursor RNA is designated SEQ ID:5981, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5981 is located from position 79828330 to position 79828454 relative to chromosome 14 on the `-` strand.

GAM2807 precursor RNA folds onto itself, forming GAM2807 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2807 precursor RNA, designated SEQ ID NO: 5981, and a schematic representation of a predicted secondary folding of GAM2807 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2807 folded precursor RNA yielding a GAM2807 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2807 RNA, hereby incorporated herein.

GAM2807 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2807 target RNA, herein designated GAM TARGET RNA. GAM2807 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2807 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2807 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2807 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2807 RNA, herein designated GAM RNA, to target binding sites on GAM2807 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2807 target RNA into GAM2807 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2807 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2807 target genes. The mRNA of each one of this plurality of GAM2807 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2807 RNA, herein designated GAM RNA, and which when bound by GAM2807 RNA causes inhibition of translation of the GAM2807 target mRNA into a corresponding GAM2807 target protein.

The mechanism of the translational inhibition exerted by GAM2807 RNA, herein designated GAM RNA, on one or more GAM2807 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2807 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2807 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2807 RNA, herein designated GAM RNA, of GAM2807 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2807 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2807 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2807 RNA correlate with, and may be deduced from, the identity of the GAM2807 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TACCATCCAT Messenger 2808 (GAM2808) oligonucleotides modulates expression of respective target genes
TAAGTGCTGC whose function and utility is known in the art.

TGATTTTGGA GAM2808 is a novel bioinformatically detectable regulatory, non protein coding,
AAGATCATGA micro RNA (miRNA)-like oligonucleotide. The method by which GAM2808 was detected is

AAAACGTCTT described with additional reference to Figs. 9-15.

TCCAAACATG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AAGGCACGTC encoded by the human genome.

GTTTGGGCAC GAM2808 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2808
AAGAGGC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2808
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2808 precursor RNA is designated SEQ ID:6530, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ

ID:6530 is located from position 53974898 to position 53975004 relative to chromosome 15 on the `-` strand.

GAM2808 precursor RNA folds onto itself, forming GAM2808 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2808 precursor RNA, designated SEQ ID NO: 6530, and a schematic representation of a predicted secondary folding of GAM2808 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2808 folded precursor RNA yielding a GAM2808 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2808 RNA, hereby incorporated herein.

GAM2808 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2808 target RNA, herein designated GAM TARGET RNA. GAM2808 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2808 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2808 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2808 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2808 RNA, herein designated GAM RNA, to target binding sites on GAM2808 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2808 target RNA into GAM2808 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2808 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2808 target genes. The mRNA of each one of this

plurality of GAM2808 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2808 RNA, herein designated GAM RNA, and which when bound by GAM2808 RNA causes inhibition of translation of the GAM2808 target mRNA into a corresponding GAM2808 target protein.

The mechanism of the translational inhibition exerted by GAM2808 RNA, herein designated GAM RNA, on one or more GAM2808 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2808 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2808 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2808 RNA, herein designated GAM RNA, of GAM2808 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2808 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2808 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2808 RNA correlate with, and may be deduced from, the identity of the GAM2808 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2817 6475 GATGGTCTCA Fig. 8 further provides a conceptual description of another novel bioinformatically
TAACTGAATA detected oligonucleotides of the present invention, referred to here as Genomic Address
TATTAAAAAC Messenger 2817 (GAM2817) oligonucleotides modulates expression of respective target genes
TTAAATTGTA whose function and utility is known in the art.

TACTTTAAGT GAM2817 is a novel bioinformatically detectable regulatory, non protein coding,
TGGTGATTGT micro RNA (miRNA)-like oligonucleotide. The method by which GAM2817 was detected is

ATGATATATG described with additional reference to Figs. 9-15.

AGTTTTATC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM2817 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2817

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2817

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2817 precursor RNA is designated SEQ ID:6475, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6475 is located from position 15101514 to position 15101592 relative to chromosome 16 on the `-` strand.

GAM2817 precursor RNA folds onto itself, forming GAM2817 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2817 precursor RNA, designated SEQ ID NO: 6475, and a schematic representation of a predicted secondary folding of GAM2817 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2817 folded precursor RNA yielding a GAM2817 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2817 RNA, hereby incorporated herein.

GAM2817 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2817 target RNA, herein designated GAM TARGET RNA. GAM2817 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2817 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2817 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2817 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2817 RNA, herein designated GAM RNA, to target binding sites on GAM2817 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2817 target RNA

into GAM2817 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2817 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2817 target genes. The mRNA of each one of this plurality of GAM2817 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2817 RNA, herein designated GAM RNA, and which when bound by GAM2817 RNA causes inhibition of translation of the GAM2817 target mRNA into a corresponding GAM2817 target protein.

The mechanism of the translational inhibition exerted by GAM2817 RNA, herein designated GAM RNA, on one or more GAM2817 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2817 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2817 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2817 RNA, herein designated GAM RNA, of GAM2817 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2817 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2817 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2817 RNA correlate with, and may be deduced from, the identity of the GAM2817 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2839 6184 CTCTTGACCA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAGGGTCTCA detected oligonucleotides of the present invention, referred to here as Genomic Address

AATGAGGGAC Messenger 2839 (GAM2839) oligonucleotides modulates expression of respective target genes

ATTTTACCTG whose function and utility is known in the art.

CCAGGGGACA GAM2839 is a novel bioinformatically detectable regulatory, non protein coding,

TTTCCAATGT micro RNA (miRNA)-like oligonucleotide. The method by which GAM2839 was detected is

TTGGGGACAC described with additional reference to Figs. 9-15.

TTTTGGTTAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAGAG encoded by the human genome.

GAM2839 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2839 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2839 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2839 precursor RNA is designated SEQ ID:6184, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6184 is located from position 21329921 to position 21330005 relative to chromosome 5 on the `+` strand.

GAM2839 precursor RNA folds onto itself, forming GAM2839 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2839 precursor RNA, designated SEQ ID NO: 6184, and a schematic representation of a predicted secondary folding of GAM2839 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2839 folded precursor RNA yielding a GAM2839 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM2839 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2839 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM2839 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2839 target RNA, herein designated GAM TARGET RNA. GAM2839 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2839 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2839 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2839 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region

or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2839 RNA, herein designated GAM RNA, to target binding sites on GAM2839 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2839 target RNA into GAM2839 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2839 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2839 target genes. The mRNA of each one of this plurality of GAM2839 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2839 RNA, herein designated GAM RNA, and which when bound by GAM2839 RNA causes inhibition of translation of the GAM2839 target mRNA into a corresponding GAM2839 target protein.

The mechanism of the translational inhibition exerted by GAM2839 RNA, herein designated GAM RNA, on one or more GAM2839 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2839 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2839 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2839 RNA, herein designated GAM RNA, of GAM2839 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2839 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2839 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2839 RNA correlate with, and may be deduced from, the identity of the GAM2839 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2846 6159 CTCAGCCTCT Fig. 8 further provides a conceptual description of another novel bioinformatically
CCCTGATGTA detected oligonucleotides of the present invention, referred to here as Genomic Address
ATCTGGGTTC Messenger 2846 (GAM2846) oligonucleotides modulates expression of respective target genes
CTTGTGTGGC whose function and utility is known in the art.

AACAGTAATG GAM2846 is a novel bioinformatically detectable regulatory, non protein coding,

GGAAGAAAGG micro RNA (miRNA)-like oligonucleotide. The method by which GAM2846 was detected is

ACCTGAAATA described with additional reference to Figs. 9-15.

TTAGTTGATT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CCAAGGGACC encoded by the human genome.

CTCTAAGGTT GAM2846 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2846

AGAGAGGCAG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2846

AG precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2846 precursor RNA is designated SEQ ID:6159, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6159 is located from position 143268257 to position 143268368 relative to chromosome 7 on the `+` strand.

GAM2846 precursor RNA folds onto itself, forming GAM2846 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2846 precursor RNA, designated SEQ ID NO: 6159, and a schematic representation of a predicted secondary folding of GAM2846 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2846 folded precursor RNA yielding a GAM2846 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2846 RNA, hereby incorporated herein.

GAM2846 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2846 target RNA, herein designated GAM TARGET RNA. GAM2846 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2846 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2846 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2846 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows

three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2846 RNA, herein designated GAM RNA, to target binding sites on GAM2846 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2846 target RNA into GAM2846 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2846 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2846 target genes. The mRNA of each one of this plurality of GAM2846 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2846 RNA, herein designated GAM RNA, and which when bound by GAM2846 RNA causes inhibition of translation of the GAM2846 target mRNA into a corresponding GAM2846 target protein.

The mechanism of the translational inhibition exerted by GAM2846 RNA, herein designated GAM RNA, on one or more GAM2846 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2846 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2846 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2846 RNA, herein designated GAM RNA, of GAM2846 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2846 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2846 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2846 RNA correlate with, and may be deduced from, the identity of the GAM2846 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2868 6101 CCGTGGCCCG TGTTCTCTCC Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address

TTTTGTCCCC Messenger 2868 (GAM2868) oligonucleotides modulates expression of respective target genes

ATAGTGTGAC whose function and utility is known in the art.

TCCGCCAGGA GAM2868 is a novel bioinformatically detectable regulatory, non protein coding, ACTTGGAATG micro RNA (miRNA)-like oligonucleotide. The method by which GAM2868 was detected is

GCTGAAGACT described with additional reference to Figs. 9-15.

GTGAATGAGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GTCATGGGTC encoded by the human genome.

TGTGG GAM2868 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2868 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2868 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2868 precursor RNA is designated SEQ ID:6101, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6101 is located from position 78873561 to position 78873655 relative to chromosome 17 on the `+` strand.

GAM2868 precursor RNA folds onto itself, forming GAM2868 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2868 precursor RNA, designated SEQ ID NO: 6101, and a schematic representation of a predicted secondary folding of GAM2868 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2868 folded precursor RNA yielding a GAM2868 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2868 RNA, hereby incorporated herein.

GAM2868 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2868 target RNA, herein designated GAM TARGET RNA. GAM2868 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2868 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2868 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2868 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2868 RNA, herein designated GAM RNA, to target binding sites on GAM2868 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2868 target RNA into GAM2868 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2868 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2868 target genes. The mRNA of each one of this plurality of GAM2868 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2868 RNA, herein designated GAM RNA, and which when bound by GAM2868 RNA causes inhibition of translation of the GAM2868 target mRNA into a corresponding GAM2868 target protein.

The mechanism of the translational inhibition exerted by GAM2868 RNA, herein designated GAM RNA, on one or more GAM2868 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2868 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2868 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2868 RNA, herein designated GAM RNA, of GAM2868 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

GTAACACGGG Messenger 2887 (GAM2887) oligonucleotides modulates expression of respective target genes

CCTGAGGTCA whose function and utility is known in the art.

GCAGTAGAGG GAM2887 is a novel bioinformatically detectable regulatory, non protein coding,

ACCAGTATTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM2887 was detected is

GTTTTGGCCC described with additional reference to Figs. 9-15.

CAGCCTCTGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GTGGATGGAT encoded by the human genome.

TGAACGCC GAM2887 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2887

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2887

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2887 precursor RNA is designated SEQ ID:6844, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6844 is located from position 69517026 to position 69517123 relative to chromosome 11 on the `-` strand.

GAM2887 precursor RNA folds onto itself, forming GAM2887 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2887 precursor RNA, designated SEQ ID NO: 6844, and a schematic representation of a predicted secondary folding of GAM2887 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2887 folded precursor RNA yielding a GAM2887 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2887 RNA, hereby incorporated herein.

GAM2887 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2887 target RNA, herein designated GAM TARGET RNA. GAM2887 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2887 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2887 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2887 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2887 RNA, herein designated GAM RNA, to target binding sites on GAM2887 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2887 target RNA into GAM2887 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2887 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2887 target genes. The mRNA of each one of this plurality of GAM2887 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2887 RNA, herein designated GAM RNA, and which when bound by GAM2887 RNA causes inhibition of translation of the GAM2887 target mRNA into a corresponding GAM2887 target protein.

The mechanism of the translational inhibition exerted by GAM2887 RNA, herein designated GAM RNA, on one or more GAM2887 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2887 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2887 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2887 RNA, herein designated GAM RNA, of GAM2887 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2887 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2887 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2887 RNA correlate with, and may be deduced from, the identity of the GAM2887 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2908 6735 GGCAGGAGAA Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGCTTGAAC detected oligonucleotides of the present invention, referred to here as Genomic Address

ACAGGAGGCA Messenger 2908 (GAM2908) oligonucleotides modulates expression of respective target genes

GAGATTGCAG whose function and utility is known in the art.

TGAGTCAAGA GAM2908 is a novel bioinformatically detectable regulatory, non protein coding,

TCATGCCACT micro RNA (miRNA)-like oligonucleotide. The method by which GAM2908 was detected is

GCACTCCAGC described with additional reference to Figs. 9-15.

ACTCCAGCCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AAGTGACAGA encoded by the human genome.

GCAAGATCCT GAM2908 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2908

GTT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2908

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2908 precursor RNA is designated SEQ ID:6735, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6735 is located from position 51977188 to position 51977290 relative to chromosome 19 on the `+` strand.

GAM2908 precursor RNA folds onto itself, forming GAM2908 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2908 precursor RNA, designated SEQ ID NO: 6735, and a schematic representation of a predicted secondary folding of GAM2908 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2908 folded precursor RNA yielding a GAM2908 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the

nucleotide sequence of GAM2908 RNA, hereby incorporated herein.

GAM2908 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2908 target RNA, herein designated GAM TARGET RNA. GAM2908 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2908 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2908 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2908 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2908 RNA, herein designated GAM RNA, to target binding sites on GAM2908 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2908 target RNA into GAM2908 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2908 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2908 target genes. The mRNA of each one of this plurality of GAM2908 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2908 RNA, herein designated GAM RNA, and which when bound by GAM2908 RNA causes inhibition of translation of the GAM2908 target mRNA into a corresponding GAM2908 target protein.

The mechanism of the translational inhibition exerted by GAM2908 RNA, herein designated GAM RNA, on one or more GAM2908 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2908 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2908 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2908 RNA, herein designated GAM RNA, of GAM2908 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2908 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2908 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2908 RNA correlate with, and may be deduced from, the identity of the GAM2908 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2911 6220 CTGCCTCTCT Fig. 8 further provides a conceptual description of another novel bioinformatically
GCAGGCCGTG detected oligonucleotides of the present invention, referred to here as Genomic Address
TGCTTTGCTC Messenger 2911 (GAM2911) oligonucleotides modulates expression of respective target genes
GGTTGATCTT whose function and utility is known in the art.

GCAGAGCCTA GAM2911 is a novel bioinformatically detectable regulatory, non protein coding,
AGACACAGGC micro RNA (miRNA)-like oligonucleotide. The method by which GAM2911 was detected is

CCAGAGAGGC described with additional reference to Figs. 9-15.

AG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM2911 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2911

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2911
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2911 precursor RNA is designated SEQ ID:6220, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6220 is located from position 50818311 to position 50818382 relative to chromosome 19 on the `+` strand.

GAM2911 precursor RNA folds onto itself, forming GAM2911 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2911 precursor RNA, designated SEQ ID NO: 6220, and a schematic representation of a predicted secondary folding of GAM2911 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2911 folded precursor RNA

yielding a GAM2911 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2911 RNA, hereby incorporated herein.

GAM2911 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2911 target RNA, herein designated GAM TARGET RNA. GAM2911 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2911 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2911 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2911 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2911 RNA, herein designated GAM RNA, to target binding sites on GAM2911 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2911 target RNA into GAM2911 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2911 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2911 target genes. The mRNA of each one of this plurality of GAM2911 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2911 RNA, herein designated GAM RNA, and which when bound by GAM2911 RNA causes inhibition of translation of the GAM2911 target mRNA into a corresponding GAM2911 target protein.

The mechanism of the translational inhibition exerted by GAM2911 RNA, herein designated GAM RNA, on one or more GAM2911 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2911 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2911 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2911 RNA, herein designated GAM RNA, of GAM2911 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2911 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2911 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2911 RNA correlate with, and may be deduced from, the identity of the GAM2911 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2920 6761 GGCTGAGACC Fig. 8 further provides a conceptual description of another novel bioinformatically

GCCCCCTTCT Messenger 2920 (GAM2920) oligonucleotides modulates expression of respective target genes

TTCTGCCTTA whose function and utility is known in the art.

AGAATGTCCT GAM2920 is a novel bioinformatically detectable regulatory, non protein coding,

TTTAGGCTGG micro RNA (miRNA)-like oligonucleotide. The method by which GAM2920 was detected is

GCATGGTGGC described with additional reference to Figs. 9-15.

TCACGCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM2920 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2920

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2920

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2920 precursor RNA is designated SEQ ID:6761, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6761 is located from position 1319193 to position 1319269 relative to chromosome 17 on the `-` strand.

GAM2920 precursor RNA folds onto itself, forming GAM2920 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2920 precursor RNA, designated SEQ ID NO: 6761, and a

schematic representation of a predicted secondary folding of GAM2920 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2920 folded precursor RNA yielding a GAM2920 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM2920 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2920 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM2920 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2920 target RNA, herein designated GAM TARGET RNA. GAM2920 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2920 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2920 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2920 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2920 RNA, herein designated GAM RNA, to target binding sites on GAM2920 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2920 target RNA into GAM2920 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2920 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2920 target genes. The mRNA of each one of this plurality of GAM2920 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2920 RNA, herein designated GAM RNA, and which when bound by GAM2920 RNA causes inhibition of translation of the GAM2920 target mRNA into a corresponding GAM2920 target protein.

The mechanism of the translational inhibition exerted by GAM2920 RNA, herein designated GAM RNA, on one or more GAM2920 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2920 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2920 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2920 RNA, herein designated GAM RNA, of GAM2920 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2920 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2920 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2920 RNA correlate with, and may be deduced from, the identity of the GAM2920 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TCTGCAGTCT detected oligonucleotides of the present invention, referred to here as Genomic Address

GGTATGTTTT Messenger 2927 (GAM2927) oligonucleotides modulates expression of respective target genes

TCCCCCTAAG whose function and utility is known in the art.

AACCTCAGCT GAM2927 is a novel bioinformatically detectable regulatory, non protein coding,

GAGAAATAAA micro RNA (miRNA)-like oligonucleotide. The method by which GAM2927 was detected is

GCAGGTTAAC described with additional reference to Figs. 9-15.

AAAGCTGTAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAAATGTCAC encoded by the human genome.

TGG GAM2927 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2927

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2927

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2927 precursor RNA is designated SEQ ID:6056, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6056 is located from position 12168404 to position 12168496 relative to chromosome 10 on the `-` strand.

GAM2927 precursor RNA folds onto itself, forming GAM2927 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2927 precursor RNA, designated SEQ ID NO: 6056, and a schematic representation of a predicted secondary folding of GAM2927 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2927 folded precursor RNA yielding a GAM2927 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2927 RNA, hereby incorporated herein.

GAM2927 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2927 target RNA, herein designated GAM TARGET RNA. GAM2927 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2927 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2927 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2927 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2927 RNA, herein designated GAM RNA, to target binding sites on GAM2927 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2927 target RNA into GAM2927 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2927 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2927 target genes. The mRNA of each one of this plurality of GAM2927 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2927 RNA, herein designated GAM RNA, and which when bound by GAM2927 RNA causes inhibition of translation of the GAM2927 target mRNA into a corresponding GAM2927 target protein.

The mechanism of the translational inhibition exerted by GAM2927 RNA, herein designated GAM RNA, on one or more GAM2927 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2927 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2927 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2927 RNA, herein designated GAM RNA, of GAM2927 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2927 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2927 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2927 RNA correlate with, and may be deduced from, the identity of the GAM2927 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TGGAGAGAGC detected oligonucleotides of the present invention, referred to here as Genomic Address
AGGTTGCTAA Messenger 2931 (GAM2931) oligonucleotides modulates expression of respective target genes
GAAGAATCTG whose function and utility is known in the art.

GCTTCTTCAG GAM2931 is a novel bioinformatically detectable regulatory, non protein coding,
TCAGCGCTCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM2931 was detected is

TGCTTCCTAT described with additional reference to Figs. 9-15.

CTCTCCATGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GATCT encoded by the human genome.

GAM2931 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2931

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2931

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2931 precursor RNA is designated SEQ ID:6723, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ

ID:6723 is located from position 97874565 to position 97874649 relative to chromosome 8 on the `+` strand.

GAM2931 precursor RNA folds onto itself, forming GAM2931 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2931 precursor RNA, designated SEQ ID NO: 6723, and a schematic representation of a predicted secondary folding of GAM2931 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2931 folded precursor RNA yielding a GAM2931 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2931 RNA, hereby incorporated herein.

GAM2931 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2931 target RNA, herein designated GAM TARGET RNA. GAM2931 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2931 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2931 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2931 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2931 RNA, herein designated GAM RNA, to target binding sites on GAM2931 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2931 target RNA into GAM2931 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2931 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2931 target genes. The mRNA of each one of this

plurality of GAM2931 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2931 RNA, herein designated GAM RNA, and which when bound by GAM2931 RNA causes inhibition of translation of the GAM2931 target mRNA into a corresponding GAM2931 target protein.

The mechanism of the translational inhibition exerted by GAM2931 RNA, herein designated GAM RNA, on one or more GAM2931 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2931 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2931 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2931 RNA, herein designated GAM RNA, of GAM2931 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2931 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2931 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2931 RNA correlate with, and may be deduced from, the identity of the GAM2931 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM2950 6060 CCATCTGGCA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAACACTGGG detected oligonucleotides of the present invention, referred to here as Genomic Address

CAAAAGAGGT Messenger 2950 (GAM2950) oligonucleotides modulates expression of respective target genes

TCTGATTCTG whose function and utility is known in the art.

GCCTGTTACT GAM2950 is a novel bioinformatically detectable regulatory, non protein coding,

TGCTGTACAA micro RNA (miRNA)-like oligonucleotide. The method by which GAM2950 was detected is

ACTTGCACAA described with additional reference to Figs. 9-15.

GGCCAGAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GACTCTCTTT encoded by the human genome.

TCCCATCTGC GAM2950 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM2950

AAAGTGG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM2950 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2950 precursor RNA is designated SEQ ID:6060, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6060 is located from position 170095979 to position 170096085 relative to chromosome 5 on the `-` strand.

GAM2950 precursor RNA folds onto itself, forming GAM2950 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM2950 precursor RNA, designated SEQ ID NO: 6060, and a schematic representation of a predicted secondary folding of GAM2950 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM2950 folded precursor RNA yielding a GAM2950 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM2950 RNA, hereby incorporated herein.

GAM2950 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2950 target RNA, herein designated GAM TARGET RNA. GAM2950 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM2950 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2950 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2950 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM2950 RNA, herein designated GAM RNA, to target binding sites on GAM2950 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2950 target RNA

into GAM2950 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM2950 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2950 target genes. The mRNA of each one of this plurality of GAM2950 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2950 RNA, herein designated GAM RNA, and which when bound by GAM2950 RNA causes inhibition of translation of the GAM2950 target mRNA into a corresponding GAM2950 target protein.

The mechanism of the translational inhibition exerted by GAM2950 RNA, herein designated GAM RNA, on one or more GAM2950 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM2950 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM2950 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM2950 RNA, herein designated GAM RNA, of GAM2950 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM2950 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM2950 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM2950 RNA correlate with, and may be deduced from, the identity of the GAM2950 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3004 6092 CCCTGTCCTG Fig. 8 further provides a conceptual description of another novel bioinformatically

TCTTCGAGTA detected oligonucleotides of the present invention, referred to here as Genomic Address

TTTGTTTTTA Messenger 3004 (GAM3004) oligonucleotides modulates expression of respective target genes

ATGCTGGGTG whose function and utility is known in the art.

TCGATCGAGA GAM3004 is a novel bioinformatically detectable regulatory, non protein coding,

CAACAAGCGC micro RNA (miRNA)-like oligonucleotide. The method by which GAM3004 was detected is

TCAGAGCAAA described with additional reference to Figs. 9-15.

GCAAGGATGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ATTACGGGG encoded by the human genome.

GAM3004 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3004 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3004 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3004 precursor RNA is designated SEQ ID:6092, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6092 is located from position 79931895 to position 79931983 relative to chromosome 17 on the `-` strand.

GAM3004 precursor RNA folds onto itself, forming GAM3004 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3004 precursor RNA, designated SEQ ID NO: 6092, and a schematic representation of a predicted secondary folding of GAM3004 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3004 folded precursor RNA yielding a GAM3004 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3004 RNA, hereby incorporated herein.

GAM3004 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3004 target RNA, herein designated GAM TARGET RNA. GAM3004 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3004 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3004 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3004 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3004 RNA, herein designated GAM RNA, to target binding sites on GAM3004 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3004 target RNA into GAM3004 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3004 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3004 target genes. The mRNA of each one of this plurality of GAM3004 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3004 RNA, herein designated GAM RNA, and which when bound by GAM3004 RNA causes inhibition of translation of the GAM3004 target mRNA into a corresponding GAM3004 target protein.

The mechanism of the translational inhibition exerted by GAM3004 RNA, herein designated GAM RNA, on one or more GAM3004 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3004 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3004 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3004 RNA, herein designated GAM RNA, of GAM3004 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3004 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3004 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3004 RNA correlate with, and may be deduced from, the identity of the GAM3004 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3028 5798 AGGTTCTGGT GAATTCAGGA TGGTATTTTT GTCTTTGAAT AGTTTCTGGT TGCATTTCTA

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 3028 (GAM3028) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM3028 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM3028 was detected is

TAGTGGGGGT described with additional reference to Figs. 9-15.

GAAGCTAGGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAACTTCTGT encoded by the human genome.

GATCTTCCTG GAM3028 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3028

AGGTCACTTC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3028

AAAGTGCCT precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3028 precursor RNA is designated SEQ ID:5798, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5798 is located from position 1293547 to position 1293665 relative to chromosome 18 on the `+` strand.

GAM3028 precursor RNA folds onto itself, forming GAM3028 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3028 precursor RNA, designated SEQ ID NO: 5798, and a schematic representation of a predicted secondary folding of GAM3028 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3028 folded precursor RNA yielding a GAM3028 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3028 RNA, hereby incorporated herein.

GAM3028 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3028 target RNA, herein designated GAM TARGET RNA. GAM3028 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3028 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3028 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3028 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3028 RNA, herein designated GAM RNA, to target binding sites on GAM3028 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3028 target RNA into GAM3028 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3028 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3028 target genes. The mRNA of each one of this plurality of GAM3028 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3028 RNA, herein designated GAM RNA, and which when bound by GAM3028 RNA causes inhibition of translation of the GAM3028 target mRNA into a corresponding GAM3028 target protein.

The mechanism of the translational inhibition exerted by GAM3028 RNA, herein designated GAM RNA, on one or more GAM3028 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3028 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3028 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3028 RNA, herein designated GAM RNA, of GAM3028 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3028 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3028 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3028 RNA correlate with, and may be deduced from, the identity of the GAM3028 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3057 6272 CTTTCTGTGC CACTCAGGAA GCAATGGGCA Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 3057 (GAM3057) oligonucleotides modulates expression of respective target genes

TGATTCAGCA whose function and utility is known in the art.

GAGGAGAGGA GAM3057 is a novel bioinformatically detectable regulatory, non protein coding, GAGTTTAGAA micro RNA (miRNA)-like oligonucleotide. The method by which GAM3057 was detected is

CTGGTTATGC described with additional reference to Figs. 9-15.

TTCCTTCTCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AACCCTCCCT encoded by the human genome.

GCAAAAACAC GAM3057 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3057

TGGCCAGCTC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3057

CTGACATCAC precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar

AGTAAGACAG to the nucleotide sequence of GAM3057 precursor RNA is designated SEQ ID:6272, and is

provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6272 is located from position 8202273 to position 8202402 relative to chromosome 19 on the `+` strand.

GAM3057 precursor RNA folds onto itself, forming GAM3057 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3057 precursor RNA, designated SEQ ID NO: 6272, and a schematic representation of a predicted secondary folding of GAM3057 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3057 folded precursor RNA yielding a GAM3057 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3057 RNA, hereby incorporated herein.

GAM3057 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3057 target RNA, herein designated GAM TARGET RNA. GAM3057 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3057 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM3057 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3057 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3057 RNA, herein designated GAM RNA, to target binding sites on GAM3057 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3057 target RNA into GAM3057 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3057 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3057 target genes. The mRNA of each one of this plurality of GAM3057 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3057 RNA, herein designated GAM RNA, and which when bound by GAM3057 RNA causes inhibition of translation of the GAM3057 target mRNA into a corresponding GAM3057 target protein.

The mechanism of the translational inhibition exerted by GAM3057 RNA, herein designated GAM RNA, on one or more GAM3057 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3057 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3057 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3057 RNA, herein designated GAM RNA, of GAM3057 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3057 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3057 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3057 RNA correlate with, and may be deduced from, the identity of the GAM3057 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

AACTGCTTAA GAM3064 is a novel bioinformatically detectable regulatory, non protein coding,
GCTTATTATT micro RNA (miRNA)-like oligonucleotide. The method by which GAM3064 was detected is

AATATTTAAG described with additional reference to Figs. 9-15.

CTATAGTTCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGGCCCATTC encoded by the human genome.

CAGAGGTCCC GAM3064 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3064
CCAGCC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3064

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3064 precursor RNA is designated SEQ ID:6726, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6726 is located from position 69459978 to position 69460083 relative to chromosome 16 on the `+` strand.

GAM3064 precursor RNA folds onto itself, forming GAM3064 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3064 precursor RNA, designated SEQ ID NO: 6726, and a schematic representation of a predicted secondary folding of GAM3064 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3064 folded precursor RNA yielding a GAM3064 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the

nucleotide sequence of GAM3064 RNA, hereby incorporated herein.

GAM3064 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3064 target RNA, herein designated GAM TARGET RNA. GAM3064 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3064 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3064 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3064 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3064 RNA, herein designated GAM RNA, to target binding sites on GAM3064 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3064 target RNA into GAM3064 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3064 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3064 target genes. The mRNA of each one of this plurality of GAM3064 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3064 RNA, herein designated GAM RNA, and which when bound by GAM3064 RNA causes inhibition of translation of the GAM3064 target mRNA into a corresponding GAM3064 target protein.

The mechanism of the translational inhibition exerted by GAM3064 RNA, herein designated GAM RNA, on one or more GAM3064 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3064 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3064 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3064 RNA, herein designated GAM RNA, of GAM3064 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3064 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3064 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3064 RNA correlate with, and may be deduced from, the identity of the GAM3064 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3065 6704 GGAGACATGA Fig. 8 further provides a conceptual description of another novel bioinformatically
TGTAGCAGAT detected oligonucleotides of the present invention, referred to here as Genomic Address
GATGGGACTG Messenger 3065 (GAM3065) oligonucleotides modulates expression of respective target genes
TCTTACATAA whose function and utility is known in the art.

CTGGATCTTT GAM3065 is a novel bioinformatically detectable regulatory, non protein coding,
TAGAACTATC micro RNA (miRNA)-like oligonucleotide. The method by which GAM3065 was detected is

GAAGATTAAG described with additional reference to Figs. 9-15.

TAGTAAAATG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GTATAAAAAG encoded by the human genome.

TTTCTTGACA GAM3065 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3065
ATGTTATTTT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3065
CC precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3065 precursor RNA is designated SEQ ID:6704, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6704 is located from position 120332544 to position 120332655 relative to chromosome 11 on the `+` strand.

GAM3065 precursor RNA folds onto itself, forming GAM3065 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3065 precursor RNA, designated SEQ ID NO: 6704, and a schematic representation of a predicted secondary folding of GAM3065 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3065 folded precursor RNA

yielding a GAM3065 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3065 RNA, hereby incorporated herein.

GAM3065 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3065 target RNA, herein designated GAM TARGET RNA. GAM3065 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3065 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3065 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3065 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3065 RNA, herein designated GAM RNA, to target binding sites on GAM3065 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3065 target RNA into GAM3065 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3065 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3065 target genes. The mRNA of each one of this plurality of GAM3065 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3065 RNA, herein designated GAM RNA, and which when bound by GAM3065 RNA causes inhibition of translation of the GAM3065 target mRNA into a corresponding GAM3065 target protein.

The mechanism of the translational inhibition exerted by GAM3065 RNA, herein designated GAM RNA, on one or more GAM3065 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3065 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3065 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3065 RNA, herein designated GAM RNA, of GAM3065 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3065 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3065 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3065 RNA correlate with, and may be deduced from, the identity of the GAM3065 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3077 6030 CAGGTGTGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

CTACCATGCC detected oligonucleotides of the present invention, referred to here as Genomic Address

TGGCTAATTT Messenger 3077 (GAM3077) oligonucleotides modulates expression of respective target genes

TTGTATTTTT whose function and utility is known in the art.

GGTAGAAACA GAM3077 is a novel bioinformatically detectable regulatory, non protein coding,

GGGTTTTACC micro RNA (miRNA)-like oligonucleotide. The method by which GAM3077 was detected is

ATGTTGGCCA described with additional reference to Figs. 9-15.

GGCTGGTCTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAACTTCTG encoded by the human genome.

GAM3077 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3077

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3077

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3077 precursor RNA is designated SEQ ID:6030, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6030 is located from position 127843803 to position 127843891 relative to chromosome 7 on the `+` strand.

GAM3077 precursor RNA folds onto itself, forming GAM3077 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3077 precursor RNA, designated SEQ ID NO: 6030, and a

schematic representation of a predicted secondary folding of GAM3077 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3077 folded precursor RNA yielding a GAM3077 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3077 RNA, hereby incorporated herein.

GAM3077 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3077 target RNA, herein designated GAM TARGET RNA. GAM3077 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3077 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3077 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3077 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3077 RNA, herein designated GAM RNA, to target binding sites on GAM3077 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3077 target RNA into GAM3077 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3077 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3077 target genes. The mRNA of each one of this plurality of GAM3077 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3077 RNA, herein designated GAM RNA, and which when bound by GAM3077 RNA causes inhibition of translation of the GAM3077 target mRNA into a corresponding GAM3077 target protein.

The mechanism of the translational inhibition exerted by GAM3077 RNA, herein designated GAM RNA, on one or more GAM3077 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3077 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3077 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3077 RNA, herein designated GAM RNA, of GAM3077 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3077 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3077 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3077 RNA correlate with, and may be deduced from, the identity of the GAM3077 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3081 6109 CCTCAGCCTC Fig. 8 further provides a conceptual description of another novel bioinformatically

CCAAAGTGCT detected oligonucleotides of the present invention, referred to here as Genomic Address

GGGATTACAG Messenger 3081 (GAM3081) oligonucleotides modulates expression of respective target genes

GTGTGAACCA whose function and utility is known in the art.

CCATGCCCGG GAM3081 is a novel bioinformatically detectable regulatory, non protein coding,

CAGTGATTCA micro RNA (miRNA)-like oligonucleotide. The method by which GAM3081 was detected is

TTTCTAAACC described with additional reference to Figs. 9-15.

CAGCTTGTTA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AAAGGTGAGG encoded by the human genome.

GAM3081 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3081

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3081

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3081 precursor RNA is designated SEQ ID:6109, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6109 is located from position 23059753 to position 23059842 relative to chromosome 19 on the `+` strand.

GAM3081 precursor RNA folds onto itself, forming GAM3081 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3081 precursor RNA, designated SEQ ID NO: 6109, and a schematic representation of a predicted secondary folding of GAM3081 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3081 folded precursor RNA yielding a GAM3081 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM3081 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3081 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM3081 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3081 target RNA, herein designated GAM TARGET RNA. GAM3081 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3081 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3081 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3081 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3081 RNA, herein designated GAM RNA, to target binding sites on GAM3081 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3081 target RNA into GAM3081 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3081 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3081 target genes. The mRNA of each one of this plurality of GAM3081 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3081 RNA, herein designated GAM RNA, and which when bound by GAM3081 RNA causes inhibition of translation of the GAM3081 target mRNA into a corresponding GAM3081 target protein.

The mechanism of the translational inhibition exerted by GAM3081 RNA, herein designated GAM RNA, on one or more GAM3081 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3081 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3081 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3081 RNA, herein designated GAM RNA, of GAM3081 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3081 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3081 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3081 RNA correlate with, and may be deduced from, the identity of the GAM3081 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3089 7090 TGACACTTTC Fig. 8 further provides a conceptual description of another novel bioinformatically
TGTAAACGCC detected oligonucleotides of the present invention, referred to here as Genomic Address
ATCTGTGCTT Messenger 3089 (GAM3089) oligonucleotides modulates expression of respective target genes
TTCTCCCATT whose function and utility is known in the art.

TGTACTGCCC GAM3089 is a novel bioinformatically detectable regulatory, non protein coding,
TGTATATCCC micro RNA (miRNA)-like oligonucleotide. The method by which GAM3089 was detected is

CGTTCAGCAT described with additional reference to Figs. 9-15.

TGCCAGTGTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TCCAGCCACC encoded by the human genome.

TCTTAAAGCA GAM3089 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3089
TTCTGAAGTT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3089
TCA precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3089 precursor RNA is designated SEQ ID:7090, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ

ID:7090 is located from position 39513226 to position 39513338 relative to chromosome 19 on the `+` strand.

GAM3089 precursor RNA folds onto itself, forming GAM3089 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3089 precursor RNA, designated SEQ ID NO: 7090, and a schematic representation of a predicted secondary folding of GAM3089 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3089 folded precursor RNA yielding a GAM3089 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3089 RNA, hereby incorporated herein.

GAM3089 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3089 target RNA, herein designated GAM TARGET RNA. GAM3089 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3089 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3089 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3089 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3089 RNA, herein designated GAM RNA, to target binding sites on GAM3089 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3089 target RNA into GAM3089 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3089 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3089 target genes. The mRNA of each one of this

plurality of GAM3089 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3089 RNA, herein designated GAM RNA, and which when bound by GAM3089 RNA causes inhibition of translation of the GAM3089 target mRNA into a corresponding GAM3089 target protein.

The mechanism of the translational inhibition exerted by GAM3089 RNA, herein designated GAM RNA, on one or more GAM3089 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3089 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3089 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3089 RNA, herein designated GAM RNA, of GAM3089 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3089 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3089 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3089 RNA correlate with, and may be deduced from, the identity of the GAM3089 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3091 6308 GACAGCAGAA Fig. 8 further provides a conceptual description of another novel bioinformatically
CTTTTCTATC detected oligonucleotides of the present invention, referred to here as Genomic Address
CAAATGAATG Messenger 3091 (GAM3091) oligonucleotides modulates expression of respective target genes
CCGTCCCATG whose function and utility is known in the art.

GAAAGTGGCT GAM3091 is a novel bioinformatically detectable regulatory, non protein coding,
GTCCTGGGAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM3091 was detected is

GCTACACGTT described with additional reference to Figs. 9-15.

TCTCCAATGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGATGCTGTT encoded by the human genome.

GAM3091 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3091

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3091

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3091 precursor RNA is designated SEQ ID:6308, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6308 is located from position 96671073 to position 96671162 relative to chromosome 9 on the `+` strand.

GAM3091 precursor RNA folds onto itself, forming GAM3091 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3091 precursor RNA, designated SEQ ID NO: 6308, and a schematic representation of a predicted secondary folding of GAM3091 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3091 folded precursor RNA yielding a GAM3091 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3091 RNA, hereby incorporated herein.

GAM3091 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3091 target RNA, herein designated GAM TARGET RNA. GAM3091 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3091 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3091 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3091 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3091 RNA, herein designated GAM RNA, to target binding sites on GAM3091 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3091 target RNA

into GAM3091 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3091 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3091 target genes. The mRNA of each one of this plurality of GAM3091 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3091 RNA, herein designated GAM RNA, and which when bound by GAM3091 RNA causes inhibition of translation of the GAM3091 target mRNA into a corresponding GAM3091 target protein.

The mechanism of the translational inhibition exerted by GAM3091 RNA, herein designated GAM RNA, on one or more GAM3091 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3091 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3091 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3091 RNA, herein designated GAM RNA, of GAM3091 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3091 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3091 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3091 RNA correlate with, and may be deduced from, the identity of the GAM3091 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3123 6105 CCTACCATGA Fig. 8 further provides a conceptual description of another novel bioinformatically
CTGTTCTCAA detected oligonucleotides of the present invention, referred to here as Genomic Address
AGTTTGAAGT Messenger 3123 (GAM3123) oligonucleotides modulates expression of respective target genes
TGAGCATACC whose function and utility is known in the art.

GATGCGCCAC GAM3123 is a novel bioinformatically detectable regulatory, non protein coding,
TCCTGCTTCA micro RNA (miRNA)-like oligonucleotide. The method by which GAM3123 was detected is

ATGCTTGAGA described with additional reference to Figs. 9-15.

AGTCGTAGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM3123 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3123 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3123 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3123 precursor RNA is designated SEQ ID:6105, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6105 is located from position 63390513 to position 63390591 relative to chromosome 17 on the `+` strand.

GAM3123 precursor RNA folds onto itself, forming GAM3123 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3123 precursor RNA, designated SEQ ID NO: 6105, and a schematic representation of a predicted secondary folding of GAM3123 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3123 folded precursor RNA yielding a GAM3123 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3123 RNA, hereby incorporated herein.

GAM3123 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3123 target RNA, herein designated GAM TARGET RNA. GAM3123 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3123 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3123 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3123 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3123 RNA, herein designated GAM RNA, to target binding sites on GAM3123 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3123 target RNA into GAM3123 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3123 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3123 target genes. The mRNA of each one of this plurality of GAM3123 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3123 RNA, herein designated GAM RNA, and which when bound by GAM3123 RNA causes inhibition of translation of the GAM3123 target mRNA into a corresponding GAM3123 target protein.

The mechanism of the translational inhibition exerted by GAM3123 RNA, herein designated GAM RNA, on one or more GAM3123 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3123 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3123 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3123 RNA, herein designated GAM RNA, of GAM3123 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3123 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3123 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3123 RNA correlate with, and may be deduced from, the identity of the GAM3123 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3126 7267 TGTGAAACAC Fig. 8 further provides a conceptual description of another novel bioinformatically
AGCCAGTTTC detected oligonucleotides of the present invention, referred to here as Genomic Address
TTTGATGACT Messenger 3126 (GAM3126) oligonucleotides modulates expression of respective target genes
CAAAACGTAC whose function and utility is known in the art.

TTTGTGATCT GAM3126 is a novel bioinformatically detectable regulatory, non protein coding,
TGCCAAGCTT micro RNA (miRNA)-like oligonucleotide. The method by which GAM3126 was detected is

TGAGATCATC described with additional reference to Figs. 9-15.

GTTACAAGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GCATTTTGGT encoded by the human genome.

TGTGAAAAAC GAM3126 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3126

A precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3126

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3126 precursor RNA is designated SEQ ID:7267, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7267 is located from position 43395837 to position 43395937 relative to chromosome 17 on the `+` strand.

GAM3126 precursor RNA folds onto itself, forming GAM3126 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3126 precursor RNA, designated SEQ ID NO: 7267, and a schematic representation of a predicted secondary folding of GAM3126 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3126 folded precursor RNA yielding a GAM3126 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3126 RNA, hereby incorporated herein.

GAM3126 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3126 target RNA, herein designated GAM TARGET RNA. GAM3126 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3126 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3126 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3126 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3126 RNA, herein designated GAM RNA, to target binding sites on GAM3126 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3126 target RNA into GAM3126 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3126 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3126 target genes. The mRNA of each one of this plurality of GAM3126 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3126 RNA, herein designated GAM RNA, and which when bound by GAM3126 RNA causes inhibition of translation of the GAM3126 target mRNA into a corresponding GAM3126 target protein.

The mechanism of the translational inhibition exerted by GAM3126 RNA, herein designated GAM RNA, on one or more GAM3126 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3126 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3126 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3126 RNA, herein designated GAM RNA, of GAM3126 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3126 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3126 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3126 RNA correlate with, and may be deduced from, the identity of the GAM3126 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3132 5752 AGCTATTGTG ACAATCTTGG TTACCATCCA

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 3132 (GAM3132) oligonucleotides modulates expression of respective target genes

TTAAGTGCTG whose function and utility is known in the art.

CTGATTTTGG GAM3132 is a novel bioinformatically detectable regulatory, non protein coding, AAAGATCATG micro RNA (miRNA)-like oligonucleotide. The method by which GAM3132 was detected is

AAAAACGTCT described with additional reference to Figs. 9-15.

TTCCAAACAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAAGGCACGT encoded by the human genome.

CGTTTGGGCA GAM3132 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3132

CAAGAGGCAA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3132

ATCT precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3132 precursor RNA is designated SEQ ID:5752, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5752 is located from position 53974892 to position 53975005 relative to chromosome 15 on the `-` strand.

GAM3132 precursor RNA folds onto itself, forming GAM3132 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3132 precursor RNA, designated SEQ ID NO: 5752, and a schematic representation of a predicted secondary folding of GAM3132 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3132 folded precursor RNA yielding a GAM3132 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3132 RNA, hereby incorporated herein.

GAM3132 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3132 target RNA, herein designated GAM TARGET RNA. GAM3132 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3132 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3132 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3132 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3132 RNA, herein designated GAM RNA, to target binding sites on GAM3132 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3132 target RNA into GAM3132 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3132 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3132 target genes. The mRNA of each one of this plurality of GAM3132 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3132 RNA, herein designated GAM RNA, and which when bound by GAM3132 RNA causes inhibition of translation of the GAM3132 target mRNA into a corresponding GAM3132 target protein.

The mechanism of the translational inhibition exerted by GAM3132 RNA, herein designated GAM RNA, on one or more GAM3132 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3132 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3132 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3132 RNA, herein designated GAM RNA, of GAM3132 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3132 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3132 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3132 RNA correlate with, and may be deduced from, the identity of the GAM3132 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TCATGGAGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGCCCAGCCC encoded by the human genome.

AGATCTGCCC GAM3140 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3140
CCCTCTGAAT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3140
TTCCTGTTGC precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar
ATT to the nucleotide sequence of GAM3140 precursor RNA is designated SEQ ID:5818, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5818 is located from position 38591279 to position 38591401 relative to chromosome 17 on the `+` strand.

GAM3140 precursor RNA folds onto itself, forming GAM3140 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3140 precursor RNA, designated SEQ ID NO: 5818, and a schematic representation of a predicted secondary folding of GAM3140 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3140 folded precursor RNA yielding a GAM3140 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3140 RNA, hereby incorporated herein.

GAM3140 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3140 target RNA, herein designated GAM TARGET RNA. GAM3140 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3140 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3140 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3140 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3140 RNA, herein designated GAM RNA, to target binding sites on GAM3140 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3140 target RNA into GAM3140 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3140 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3140 target genes. The mRNA of each one of this plurality of GAM3140 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3140 RNA, herein designated GAM RNA, and which when bound by GAM3140 RNA causes inhibition of translation of the GAM3140 target mRNA into a corresponding GAM3140 target protein.

The mechanism of the translational inhibition exerted by GAM3140 RNA, herein designated GAM RNA, on one or more GAM3140 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3140 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3140 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3140 RNA, herein designated GAM RNA, of GAM3140 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM3140 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3140 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3140 RNA correlate with, and may be deduced from, the identity of the GAM3140 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3143 6754 GGCGTATCAG Fig. 8 further provides a conceptual description of another novel bioinformatically
GTTTCAGAGG detected oligonucleotides of the present invention, referred to here as Genomic Address
ATGCGGCTGG Messenger 3143 (GAM3143) oligonucleotides modulates expression of respective target genes
GAACGGGAGT whose function and utility is known in the art.

AGAGGTGAGG GAM3143 is a novel bioinformatically detectable regulatory, non protein coding,
GGTCGTTGCA micro RNA (miRNA)-like oligonucleotide. The method by which GAM3143 was detected is

TCTGTCGCGG described with additional reference to Figs. 9-15.

TGTGTATCTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTGGGGGTTC encoded by the human genome.

AGCGCC GAM3143 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3143
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3143
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3143 precursor RNA is designated SEQ ID:6754, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6754 is located from position 81003842 to position 81003937 relative to chromosome 15 on the `+` strand.

GAM3143 precursor RNA folds onto itself, forming GAM3143 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3143 precursor RNA, designated SEQ ID NO: 6754, and a schematic representation of a predicted secondary folding of GAM3143 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3143 folded precursor RNA yielding a GAM3143 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3143 RNA, hereby incorporated herein.

GAM3143 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3143 target RNA, herein designated GAM TARGET RNA. GAM3143 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3143 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3143 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3143 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3143 RNA, herein designated GAM RNA, to target binding sites on GAM3143 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3143 target RNA into GAM3143 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3143 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3143 target genes. The mRNA of each one of this plurality of GAM3143 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3143 RNA, herein designated GAM RNA, and which when bound by GAM3143 RNA causes inhibition of translation of the GAM3143 target mRNA into a corresponding GAM3143 target protein.

The mechanism of the translational inhibition exerted by GAM3143 RNA, herein designated GAM RNA, on one or more GAM3143 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3143 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3143 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3143 RNA, herein designated GAM RNA, of

GAM3143 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3143 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3143 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3143 RNA correlate with, and may be deduced from, the identity of the GAM3143 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3157 7340 TTGTTGAAGG Fig. 8 further provides a conceptual description of another novel bioinformatically

GCAGTGAAGG detected oligonucleotides of the present invention, referred to here as Genomic Address

TAGGTTTCAG Messenger 3157 (GAM3157) oligonucleotides modulates expression of respective target genes

GTTTGGTTTT whose function and utility is known in the art.

ACAAACCTGT GAM3157 is a novel bioinformatically detectable regulatory, non protein coding,

TAACTACCTC micro RNA (miRNA)-like oligonucleotide. The method by which GAM3157 was detected is

CTGTCCAGCT described with additional reference to Figs. 9-15.

TGACAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM3157 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3157

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3157

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3157 precursor RNA is designated SEQ ID:7340, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7340 is located from position 21733645 to position 21733720 relative to chromosome 14 on the `-` strand.

GAM3157 precursor RNA folds onto itself, forming GAM3157 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3157 precursor RNA, designated SEQ ID NO: 7340, and a schematic representation of a predicted secondary folding of GAM3157 folded precursor RNA,

herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3157 folded precursor RNA yielding a GAM3157 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3157 RNA, hereby incorporated herein.

GAM3157 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3157 target RNA, herein designated GAM TARGET RNA. GAM3157 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3157 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3157 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3157 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3157 RNA, herein designated GAM RNA, to target binding sites on GAM3157 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3157 target RNA into GAM3157 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3157 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3157 target genes. The mRNA of each one of this plurality of GAM3157 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3157 RNA, herein designated GAM RNA, and which when bound by GAM3157 RNA causes inhibition of translation of the GAM3157 target mRNA into a corresponding GAM3157 target protein.

The mechanism of the translational inhibition exerted by GAM3157 RNA, herein designated GAM RNA, on one or more GAM3157 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3157 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM3157 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3157 RNA, herein designated GAM RNA, of GAM3157 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3157 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3157 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3157 RNA correlate with, and may be deduced from, the identity of the GAM3157 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3163 7074 TCTGCTCATG Fig. 8 further provides a conceptual description of another novel bioinformatically

ATTACTGGGC detected oligonucleotides of the present invention, referred to here as Genomic Address

CAATACCACT Messenger 3163 (GAM3163) oligonucleotides modulates expression of respective target genes

GCAATGACTG whose function and utility is known in the art.

TCAGAACAAT GAM3163 is a novel bioinformatically detectable regulatory, non protein coding,

TCTTGTGAAA micro RNA (miRNA)-like oligonucleotide. The method by which GAM3163 was detected is

GTTGTTTTTA described with additional reference to Figs. 9-15.

TAAGCCTTGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGTTTGTTGA encoded by the human genome.

AGTTGAGGTT GAM3163 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3163

CAAGGGCAGA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3163

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3163 precursor RNA is designated SEQ ID:7074, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7074 is located from position 28262669 to position 28262778 relative to chromosome 9 on the `-` strand.

GAM3163 precursor RNA folds onto itself, forming GAM3163 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3163 precursor RNA, designated SEQ ID NO: 7074, and a schematic representation of a predicted secondary folding of GAM3163 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3163 folded precursor RNA yielding a GAM3163 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3163 RNA, hereby incorporated herein.

GAM3163 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3163 target RNA, herein designated GAM TARGET RNA. GAM3163 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3163 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3163 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3163 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3163 RNA, herein designated GAM RNA, to target binding sites on GAM3163 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3163 target RNA into GAM3163 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3163 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3163 target genes. The mRNA of each one of this plurality of GAM3163 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3163 RNA, herein designated GAM RNA, and which when bound by GAM3163 RNA causes inhibition of translation of the GAM3163 target mRNA into a corresponding GAM3163 target protein.

The mechanism of the translational inhibition exerted by GAM3163 RNA, herein designated GAM RNA, on one or more GAM3163 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3163 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3163 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3163 RNA, herein designated GAM RNA, of GAM3163 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3163 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3163 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3163 RNA correlate with, and may be deduced from, the identity of the GAM3163 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3174 5711 ACTTTTGGCT Fig. 8 further provides a conceptual description of another novel bioinformatically

CATTTTTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

TGCATGTGAC Messenger 3174 (GAM3174) oligonucleotides modulates expression of respective target genes

CTGGGATTAT whose function and utility is known in the art.

AAATGTGAAA GAM3174 is a novel bioinformatically detectable regulatory, non protein coding,

TTAGGTTTAC micro RNA (miRNA)-like oligonucleotide. The method by which GAM3174 was detected is

GAAAGGATCC described with additional reference to Figs. 9-15.

AGTGTCATTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGCATCATGG encoded by the human genome.

GCAAGGAGT GAM3174 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3174

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3174

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3174 precursor RNA is designated SEQ ID:5711, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5711 is located from position 42623627 to position 42623725 relative to chromosome 13 on the `+` strand.

GAM3174 precursor RNA folds onto itself, forming GAM3174 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3174 precursor RNA, designated SEQ ID NO: 5711, and a schematic representation of a predicted secondary folding of GAM3174 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3174 folded precursor RNA yielding a GAM3174 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3174 RNA, hereby incorporated herein.

GAM3174 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3174 target RNA, herein designated GAM TARGET RNA. GAM3174 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3174 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3174 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3174 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3174 RNA, herein designated GAM RNA, to target binding sites on GAM3174 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3174 target RNA into GAM3174 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3174 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3174 target genes. The mRNA of each one of this plurality of GAM3174 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3174 RNA, herein

designated GAM RNA, and which when bound by GAM3174 RNA causes inhibition of translation of the GAM3174 target mRNA into a corresponding GAM3174 target protein.

The mechanism of the translational inhibition exerted by GAM3174 RNA, herein designated GAM RNA, on one or more GAM3174 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3174 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3174 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3174 RNA, herein designated GAM RNA, of GAM3174 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3174 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3174 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3174 RNA correlate with, and may be deduced from, the identity of the GAM3174 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TTTTCCCCAC detected oligonucleotides of the present invention, referred to here as Genomic Address
ACTTGGAATC Messenger 3183 (GAM3183) oligonucleotides modulates expression of respective target genes
AGCCATTCCT whose function and utility is known in the art.

CCAGGGAGTG GAM3183 is a novel bioinformatically detectable regulatory, non protein coding,
CAGGTTCACA micro RNA (miRNA)-like oligonucleotide. The method by which GAM3183 was detected is

GGCTGGGCTC described with additional reference to Figs. 9-15.

TAAGAGAATT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ATAAGGT encoded by the human genome.

GAM3183 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3183

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3183

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3183 precursor RNA is designated SEQ ID:5961, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5961 is located from position 36044102 to position 36044188 relative to chromosome 17 on the `+` strand.

GAM3183 precursor RNA folds onto itself, forming GAM3183 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3183 precursor RNA, designated SEQ ID NO: 5961, and a schematic representation of a predicted secondary folding of GAM3183 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3183 folded precursor RNA yielding a GAM3183 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3183 RNA, hereby incorporated herein.

GAM3183 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3183 target RNA, herein designated GAM TARGET RNA. GAM3183 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3183 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3183 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3183 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3183 RNA, herein designated GAM RNA, to target binding sites on GAM3183 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3183 target RNA into GAM3183 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3183 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3183 target genes. The mRNA of each one of this plurality of GAM3183 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3183 RNA, herein designated GAM RNA, and which when bound by GAM3183 RNA causes inhibition of translation of the GAM3183 target mRNA into a corresponding GAM3183 target protein.

The mechanism of the translational inhibition exerted by GAM3183 RNA, herein designated GAM RNA, on one or more GAM3183 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3183 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3183 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3183 RNA, herein designated GAM RNA, of GAM3183 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3183 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3183 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3183 RNA correlate with, and may be deduced from, the identity of the GAM3183 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3190 6470 GATCATTTGA Fig. 8 further provides a conceptual description of another novel bioinformatically

AGTGCACTAT whose function and utility is known in the art.

GATGATCGTA GAM3190 is a novel bioinformatically detectable regulatory, non protein coding,

CGTATGAACA micro RNA (miRNA)-like oligonucleotide. The method by which GAM3190 was detected is

GCCATTGCAC described with additional reference to Figs. 9-15.

TCCAGCCTGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GCAATTCAGC encoded by the human genome.

AAGACATC GAM3190 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3190 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3190 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3190 precursor RNA is designated SEQ ID:6470, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6470 is located from position 95449990 to position 95450087 relative to chromosome 4 on the `+` strand.

GAM3190 precursor RNA folds onto itself, forming GAM3190 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3190 precursor RNA, designated SEQ ID NO: 6470, and a schematic representation of a predicted secondary folding of GAM3190 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3190 folded precursor RNA yielding a GAM3190 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3190 RNA, hereby incorporated herein. Expression of GAM3190 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM3190 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3190 target RNA, herein designated GAM TARGET RNA. GAM3190 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3190 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3190 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3190 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region

or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3190 RNA, herein designated GAM RNA, to target binding sites on GAM3190 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3190 target RNA into GAM3190 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3190 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3190 target genes. The mRNA of each one of this plurality of GAM3190 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3190 RNA, herein designated GAM RNA, and which when bound by GAM3190 RNA causes inhibition of translation of the GAM3190 target mRNA into a corresponding GAM3190 target protein.

The mechanism of the translational inhibition exerted by GAM3190 RNA, herein designated GAM RNA, on one or more GAM3190 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3190 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3190 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3190 RNA, herein designated GAM RNA, of GAM3190 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3190 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3190 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3190 RNA correlate with, and may be deduced from, the identity of the GAM3190 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3195 6939 GTTCCTTAGG Fig. 8 further provides a conceptual description of another novel bioinformatically
CCACACCCTG detected oligonucleotides of the present invention, referred to here as Genomic Address
CCCTCCCTGG Messenger 3195 (GAM3195) oligonucleotides modulates expression of respective target genes
ACTGCCTGAC whose function and utility is known in the art.

CTCGCTCCAA GAM3195 is a novel bioinformatically detectable regulatory, non protein coding,

GGCTCAGGGG micro RNA (miRNA)-like oligonucleotide. The method by which GAM3195 was detected is

AAGGTTCTGA described with additional reference to Figs. 9-15.

GGGCAGGTGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAAAATGCTT encoded by the human genome.

GGAAT GAM3195 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3195 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3195 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3195 precursor RNA is designated SEQ ID:6939, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6939 is located from position 68013720 to position 68013814 relative to chromosome 11 on the `+` strand.

GAM3195 precursor RNA folds onto itself, forming GAM3195 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3195 precursor RNA, designated SEQ ID NO: 6939, and a schematic representation of a predicted secondary folding of GAM3195 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3195 folded precursor RNA yielding a GAM3195 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3195 RNA, hereby incorporated herein.

GAM3195 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3195 target RNA, herein designated GAM TARGET RNA. GAM3195 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3195 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3195 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3195 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows

three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3195 RNA, herein designated GAM RNA, to target binding sites on GAM3195 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3195 target RNA into GAM3195 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3195 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3195 target genes. The mRNA of each one of this plurality of GAM3195 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3195 RNA, herein designated GAM RNA, and which when bound by GAM3195 RNA causes inhibition of translation of the GAM3195 target mRNA into a corresponding GAM3195 target protein.

The mechanism of the translational inhibition exerted by GAM3195 RNA, herein designated GAM RNA, on one or more GAM3195 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3195 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3195 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3195 RNA, herein designated GAM RNA, of GAM3195 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3195 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3195 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3195 RNA correlate with, and may be deduced from, the identity of the GAM3195 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3211 7039 TCCTCCCCCA Fig. 8 further provides a conceptual description of another novel bioinformatically

GGCATTCTGG detected oligonucleotides of the present invention, referred to here as Genomic Address

TCACTGTTCC Messenger 3211 (GAM3211) oligonucleotides modulates expression of respective target genes

TTTTTGTTGA whose function and utility is known in the art.

GATCATTCTC GAM3211 is a novel bioinformatically detectable regulatory, non protein coding, GGTGTCTCAT micro RNA (miRNA)-like oligonucleotide. The method by which GAM3211 was detected is

ATAGCTGGGT described with additional reference to Figs. 9-15.

TGCAGCTCCG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTCTTTGCCA encoded by the human genome.

GGAGGTGGTA GAM3211 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3211

ATAGAGGA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3211

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3211 precursor RNA is designated SEQ ID:7039, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7039 is located from position 55666192 to position 55666299 relative to chromosome 19 on the `+` strand.

GAM3211 precursor RNA folds onto itself, forming GAM3211 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3211 precursor RNA, designated SEQ ID NO: 7039, and a schematic representation of a predicted secondary folding of GAM3211 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3211 folded precursor RNA yielding a GAM3211 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM3211 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3211 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM3211 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3211 target RNA, herein designated GAM TARGET RNA. GAM3211 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3211 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3211 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3211 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3211 RNA, herein designated GAM RNA, to target binding sites on GAM3211 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3211 target RNA into GAM3211 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3211 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3211 target genes. The mRNA of each one of this plurality of GAM3211 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3211 RNA, herein designated GAM RNA, and which when bound by GAM3211 RNA causes inhibition of translation of the GAM3211 target mRNA into a corresponding GAM3211 target protein.

The mechanism of the translational inhibition exerted by GAM3211 RNA, herein designated GAM RNA, on one or more GAM3211 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3211 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3211 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3211 RNA, herein designated GAM RNA, of GAM3211 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3211 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3211 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3211 RNA correlate with, and may be deduced from, the identity of the GAM3211 target gene inhibited

thereby, whose functions are set forth in Table 8, incorporated herein.

GGGTATCCAG described with additional reference to Figs. 9-15.

TATCTCCGTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ATTACCTTCA encoded by the human genome.

TCTGCCCCCG GAM3263 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3263
G precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3263

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3263 precursor RNA is designated SEQ ID:6096, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6096 is located from position 127750640 to position 127750740 relative to chromosome 7 on the `-` strand.

GAM3263 precursor RNA folds onto itself, forming GAM3263 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3263 precursor RNA, designated SEQ ID NO: 6096, and a schematic representation of a predicted secondary folding of GAM3263 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3263 folded precursor RNA yielding a GAM3263 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3263 RNA, hereby incorporated herein.

GAM3263 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3263 target RNA, herein designated GAM TARGET RNA. GAM3263 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3263 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3263 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3263 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3263 RNA, herein designated GAM RNA, to target binding sites on GAM3263 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3263 target RNA into GAM3263 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3263 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3263 target genes. The mRNA of each one of this plurality of GAM3263 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3263 RNA, herein designated GAM RNA, and which when bound by GAM3263 RNA causes inhibition of translation of the GAM3263 target mRNA into a corresponding GAM3263 target protein.

The mechanism of the translational inhibition exerted by GAM3263 RNA, herein designated GAM RNA, on one or more GAM3263 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3263 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3263 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3263 RNA, herein designated GAM RNA, of GAM3263 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3263 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3263 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3263 RNA correlate with, and may be deduced from, the identity of the GAM3263 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3266 6123 CCTGTACAAA Fig. 8 further provides a conceptual description of another novel bioinformatically

GCAGCCTTGG detected oligonucleotides of the present invention, referred to here as Genomic Address

ACCAGGAGGG Messenger 3266 (GAM3266) oligonucleotides modulates expression of respective target genes

AAAACCCCAA whose function and utility is known in the art.

GGCTCTGCAG GAM3266 is a novel bioinformatically detectable regulatory, non protein coding,

CCTCCCTGCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM3266 was detected is

CCCCTCCGTT described with additional reference to Figs. 9-15.

TAAGGCTGTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GTCAGG encoded by the human genome.

GAM3266 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3266

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3266

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3266 precursor RNA is designated SEQ ID:6123, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6123 is located from position 3852982 to position 3853067 relative to chromosome 20 on the `+` strand.

GAM3266 precursor RNA folds onto itself, forming GAM3266 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3266 precursor RNA, designated SEQ ID NO: 6123, and a schematic representation of a predicted secondary folding of GAM3266 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3266 folded precursor RNA yielding a GAM3266 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3266 RNA, hereby incorporated herein.

GAM3266 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3266 target RNA, herein designated GAM TARGET RNA. GAM3266 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3266 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3266 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3266 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3266 RNA, herein designated GAM RNA, to target binding sites on GAM3266 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3266 target RNA into GAM3266 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3266 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3266 target genes. The mRNA of each one of this plurality of GAM3266 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3266 RNA, herein designated GAM RNA, and which when bound by GAM3266 RNA causes inhibition of translation of the GAM3266 target mRNA into a corresponding GAM3266 target protein.

The mechanism of the translational inhibition exerted by GAM3266 RNA, herein designated GAM RNA, on one or more GAM3266 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3266 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3266 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3266 RNA, herein designated GAM RNA, of GAM3266 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3266 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3266 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3266 RNA correlate with, and may be deduced from, the identity of the GAM3266 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3271 6468 GATATGTTTC Fig. 8 further provides a conceptual description of another novel bioinformatically

TACTAGTGGT detected oligonucleotides of the present invention, referred to here as Genomic Address

TGATGGCCTC Messenger 3271 (GAM3271) oligonucleotides modulates expression of respective target genes

TTTCAGCTCC whose function and utility is known in the art.

ATCGCTATGG GAM3271 is a novel bioinformatically detectable regulatory, non protein coding,

AGGCGAGGTT micro RNA (miRNA)-like oligonucleotide. The method by which GAM3271 was detected is

CATCAATAAC described with additional reference to Figs. 9-15.

TCAGAGAAAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTGTGTC encoded by the human genome.

GAM3271 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3271

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3271

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3271 precursor RNA is designated SEQ ID:6468, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6468 is located from position 93938749 to position 93938835 relative to chromosome 10 on the `-` strand.

GAM3271 precursor RNA folds onto itself, forming GAM3271 folded precursor RNA,

herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3271 precursor RNA, designated SEQ ID NO: 6468, and a schematic representation of a predicted secondary folding of GAM3271 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3271 folded precursor RNA yielding a GAM3271 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3271 RNA, hereby incorporated herein.

GAM3271 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3271 target RNA, herein designated GAM TARGET RNA. GAM3271 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3271 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3271 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3271 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3271 RNA, herein designated GAM RNA, to target binding sites on GAM3271 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3271 target RNA into GAM3271 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3271 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3271 target genes. The mRNA of each one of this plurality of GAM3271 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3271 RNA, herein designated GAM RNA, and which when bound by GAM3271 RNA causes inhibition of translation of the GAM3271 target mRNA into a corresponding GAM3271 target protein.

The mechanism of the translational inhibition exerted by GAM3271 RNA, herein designated GAM RNA, on one or more GAM3271 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3271 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3271 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3271 RNA, herein designated GAM RNA, of GAM3271 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3271 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3271 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3271 RNA correlate with, and may be deduced from, the identity of the GAM3271 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3293 6053 CCAGGCCTGA Fig. 8 further provides a conceptual description of another novel bioinformatically

CCTGTCTCTT detected oligonucleotides of the present invention, referred to here as Genomic Address

GAAGGAGTAT Messenger 3293 (GAM3293) oligonucleotides modulates expression of respective target genes

TTGTGTTGAA whose function and utility is known in the art.

GATGGGTGGT GAM3293 is a novel bioinformatically detectable regulatory, non protein coding,

AACGTTCAGC micro RNA (miRNA)-like oligonucleotide. The method by which GAM3293 was detected is

AAAAGCCATG described with additional reference to Figs. 9-15.

CCCAGGAGAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGGCACAGTA encoded by the human genome.

CCCATGG GAM3293 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3293

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3293

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3293 precursor RNA is designated SEQ ID:6053, and is

provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6053 is located from position 72746540 to position 72746636 relative to chromosome 11 on the `-` strand.

GAM3293 precursor RNA folds onto itself, forming GAM3293 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3293 precursor RNA, designated SEQ ID NO: 6053, and a schematic representation of a predicted secondary folding of GAM3293 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3293 folded precursor RNA yielding a GAM3293 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM3293 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3293 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM3293 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3293 target RNA, herein designated GAM TARGET RNA. GAM3293 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3293 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3293 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3293 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3293 RNA, herein designated GAM RNA, to target binding sites on GAM3293 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3293 target RNA into GAM3293 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3293 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3293 target genes. The mRNA of each one of this plurality of GAM3293 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3293 RNA, herein designated GAM RNA, and which when bound by GAM3293 RNA causes inhibition of translation of the GAM3293 target mRNA into a corresponding GAM3293 target protein.

The mechanism of the translational inhibition exerted by GAM3293 RNA, herein designated GAM RNA, on one or more GAM3293 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3293 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3293 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3293 RNA, herein designated GAM RNA, of GAM3293 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3293 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3293 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3293 RNA correlate with, and may be deduced from, the identity of the GAM3293 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3298 7336 TTGGGTCCTA Fig. 8 further provides a conceptual description of another novel bioinformatically

GTAGTACCAA detected oligonucleotides of the present invention, referred to here as Genomic Address

AGTGCTCATA Messenger 3298 (GAM3298) oligonucleotides modulates expression of respective target genes

GTGCAGGTAG whose function and utility is known in the art.

TTTTGGCATG GAM3298 is a novel bioinformatically detectable regulatory, non protein coding,

ACTCTACTGT micro RNA (miRNA)-like oligonucleotide. The method by which GAM3298 was detected is

AGTATGGGCA described with additional reference to Figs. 9-15.

CTTCCAGTAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TCTTGGATAA encoded by the human genome.

CAA GAM3298 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3298 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3298 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3298 precursor RNA is designated SEQ ID:7336, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7336 is located from position 131248823 to position 131248915 relative to chromosome X on the `-` strand.

GAM3298 precursor RNA folds onto itself, forming GAM3298 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3298 precursor RNA, designated SEQ ID NO: 7336, and a schematic representation of a predicted secondary folding of GAM3298 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3298 folded precursor RNA yielding a GAM3298 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3298 RNA, hereby incorporated herein. Expression of GAM3298 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM3298 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3298 target RNA, herein designated GAM TARGET RNA. GAM3298 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3298 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3298 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3298 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3298 RNA, herein designated GAM RNA, to target binding sites on GAM3298 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3298 target RNA into GAM3298 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3298 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3298 target genes. The mRNA of each one of this plurality of GAM3298 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3298 RNA, herein designated GAM RNA, and which when bound by GAM3298 RNA causes inhibition of translation of the GAM3298 target mRNA into a corresponding GAM3298 target protein.

The mechanism of the translational inhibition exerted by GAM3298 RNA, herein designated GAM RNA, on one or more GAM3298 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3298 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3298 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3298 RNA, herein designated GAM RNA, of GAM3298 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3298 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3298 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3298 RNA correlate with, and may be deduced from, the identity of the GAM3298 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3311 6781 GGGACTGCTG Fig. 8 further provides a conceptual description of another novel bioinformatically
TCTGCTGTCT detected oligonucleotides of the present invention, referred to here as Genomic Address
ACACTACACA Messenger 3311 (GAM3311) oligonucleotides modulates expression of respective target genes
CTACTACACT whose function and utility is known in the art.

GCTGTCTGCT GAM3311 is a novel bioinformatically detectable regulatory, non protein coding,
GTGTGTGATA micro RNA (miRNA)-like oligonucleotide. The method by which GAM3311 was detected is

AGGACACAGA described with additional reference to Figs. 9-15.

TAGTCCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM3311 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3311 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3311 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3311 precursor RNA is designated SEQ ID:6781, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6781 is located from position 47179504 to position 47179580 relative to chromosome 18 on the `+` strand.

GAM3311 precursor RNA folds onto itself, forming GAM3311 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3311 precursor RNA, designated SEQ ID NO: 6781, and a schematic representation of a predicted secondary folding of GAM3311 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3311 folded precursor RNA yielding a GAM3311 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM3311 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3311 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM3311 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3311 target RNA, herein designated GAM TARGET RNA. GAM3311 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3311 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3311 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3311 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING

SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3311 RNA, herein designated GAM RNA, to target binding sites on GAM3311 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3311 target RNA into GAM3311 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3311 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3311 target genes. The mRNA of each one of this plurality of GAM3311 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3311 RNA, herein designated GAM RNA, and which when bound by GAM3311 RNA causes inhibition of translation of the GAM3311 target mRNA into a corresponding GAM3311 target protein.

The mechanism of the translational inhibition exerted by GAM3311 RNA, herein designated GAM RNA, on one or more GAM3311 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3311 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3311 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3311 RNA, herein designated GAM RNA, of GAM3311 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3311 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3311 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3311 RNA correlate with, and may be deduced from, the identity of the GAM3311 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3330 6104 CCTACATGTG Fig. 8 further provides a conceptual description of another novel bioinformatically

TTACACTCAG detected oligonucleotides of the present invention, referred to here as Genomic Address

TGTGTAAATA Messenger 3330 (GAM3330) oligonucleotides modulates expression of respective target genes

ACTGTGAAGA whose function and utility is known in the art.

GGCAATTGTC GAM3330 is a novel bioinformatically detectable regulatory, non protein coding, AGATAGCAAA micro RNA (miRNA)-like oligonucleotide. The method by which GAM3330 was detected is

TTGGGCACCT described with additional reference to Figs. 9-15.

GCTGTGTACG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GTATATTGCA encoded by the human genome.

CTGGGGCTGA GAM3330 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3330

CGGGTGTGTA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3330

GG precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3330 precursor RNA is designated SEQ ID:6104, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6104 is located from position 62164417 to position 62164528 relative to chromosome 20 on the `-` strand.

GAM3330 precursor RNA folds onto itself, forming GAM3330 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3330 precursor RNA, designated SEQ ID NO: 6104, and a schematic representation of a predicted secondary folding of GAM3330 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3330 folded precursor RNA yielding a GAM3330 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3330 RNA, hereby incorporated herein.

GAM3330 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3330 target RNA, herein designated GAM TARGET RNA. GAM3330 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3330 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3330 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3330 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3330 RNA, herein designated GAM RNA, to target binding sites on GAM3330 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3330 target RNA into GAM3330 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3330 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3330 target genes. The mRNA of each one of this plurality of GAM3330 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3330 RNA, herein designated GAM RNA, and which when bound by GAM3330 RNA causes inhibition of translation of the GAM3330 target mRNA into a corresponding GAM3330 target protein.

The mechanism of the translational inhibition exerted by GAM3330 RNA, herein designated GAM RNA, on one or more GAM3330 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3330 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3330 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3330 RNA, herein designated GAM RNA, of GAM3330 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3330 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3330 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3330 RNA correlate with, and may be deduced from, the identity of the GAM3330 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3350 6949 GTTTTGACAA Fig. 8 further provides a conceptual description of another novel bioinformatically
ATGCAGATAC detected oligonucleotides of the present invention, referred to here as Genomic Address
ATGTGTAACT Messenger 3350 (GAM3350) oligonucleotides modulates expression of respective target genes
GAACTTATGA whose function and utility is known in the art.

CTTTCCTTAT GAM3350 is a novel bioinformatically detectable regulatory, non protein coding,
AGAAACTTCA micro RNA (miRNA)-like oligonucleotide. The method by which GAM3350 was detected is

GAAAGTTCCC described with additional reference to Figs. 9-15.

TCATACCCCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TATCTCAATC encoded by the human genome.

TTGTCACTAC GAM3350 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3350
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3350
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3350 precursor RNA is designated SEQ ID:6949, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6949 is located from position 9289824 to position 9289923 relative to chromosome 8 on the `+` strand.

GAM3350 precursor RNA folds onto itself, forming GAM3350 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3350 precursor RNA, designated SEQ ID NO: 6949, and a schematic representation of a predicted secondary folding of GAM3350 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3350 folded precursor RNA yielding a GAM3350 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3350 RNA, hereby incorporated herein.

GAM3350 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3350 target RNA, herein designated GAM TARGET RNA. GAM3350 target RNA
comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated

region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3350 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3350 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3350 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3350 RNA, herein designated GAM RNA, to target binding sites on GAM3350 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3350 target RNA into GAM3350 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3350 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3350 target genes. The mRNA of each one of this plurality of GAM3350 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3350 RNA, herein designated GAM RNA, and which when bound by GAM3350 RNA causes inhibition of translation of the GAM3350 target mRNA into a corresponding GAM3350 target protein.

The mechanism of the translational inhibition exerted by GAM3350 RNA, herein designated GAM RNA, on one or more GAM3350 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3350 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3350 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3350 RNA, herein designated GAM RNA, of GAM3350 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3350 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3350 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3350 RNA correlate with, and may be deduced from, the identity of the GAM3350 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3368 7008 TCAGATCAGT Fig. 8 further provides a conceptual description of another novel bioinformatically

GAM3422 6815 GGGGGACAGA GCGAGACTCC ATCTTTTCTG GGAGACTCCA TTGGGAGACT GTCTTTTTTG GGAGACGGAG TCGTGCCTTA GTTTCCC

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 3422 (GAM3422) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM3422 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM3422 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM3422 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3422 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3422 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3422 precursor RNA is designated SEQ ID:6815, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6815 is located from position 122969346 to position 122969432 relative to chromosome 11 on the `-` strand.

GAM3422 precursor RNA folds onto itself, forming GAM3422 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3422 precursor RNA, designated SEQ ID NO: 6815, and a schematic representation of a predicted secondary folding of GAM3422 folded precursor RNA,

herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3422 folded precursor RNA yielding a GAM3422 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3422 RNA, hereby incorporated herein.

GAM3422 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3422 target RNA, herein designated GAM TARGET RNA. GAM3422 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3422 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3422 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3422 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3422 RNA, herein designated GAM RNA, to target binding sites on GAM3422 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3422 target RNA into GAM3422 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3422 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3422 target genes. The mRNA of each one of this plurality of GAM3422 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3422 RNA, herein designated GAM RNA, and which when bound by GAM3422 RNA causes inhibition of translation of the GAM3422 target mRNA into a corresponding GAM3422 target protein.

The mechanism of the translational inhibition exerted by GAM3422 RNA, herein designated GAM RNA, on one or more GAM3422 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3422 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM3422 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3422 RNA, herein designated GAM RNA, of GAM3422 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3422 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3422 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3422 RNA correlate with, and may be deduced from, the identity of the GAM3422 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TTTACTCCCT Messenger 3426 (GAM3426) oligonucleotides modulates expression of respective target genes

GTCAGGTCAG whose function and utility is known in the art.

TAAGAGTCAC GAM3426 is a novel bioinformatically detectable regulatory, non protein coding,

CCAGTGTAAA micro RNA (miRNA)-like oligonucleotide. The method by which GAM3426 was detected is

CAGCATGAT described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM3426 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3426

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3426

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3426 precursor RNA is designated SEQ ID:5954, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5954 is located from position 98551385 to position 98551453 relative to chromosome 7 on the `+` strand.

GAM3426 precursor RNA folds onto itself, forming GAM3426 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3426 precursor RNA, designated SEQ ID NO: 5954, and a schematic representation of a predicted secondary folding of GAM3426 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3426 folded precursor RNA yielding a GAM3426 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3426 RNA, hereby incorporated herein.

GAM3426 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3426 target RNA, herein designated GAM TARGET RNA. GAM3426 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3426 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3426 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3426 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3426 RNA, herein designated GAM RNA, to target binding sites on GAM3426 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3426 target RNA into GAM3426 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3426 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3426 target genes. The mRNA of each one of this plurality of GAM3426 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3426 RNA, herein designated GAM RNA, and which when bound by GAM3426 RNA causes inhibition of translation of the GAM3426 target mRNA into a corresponding GAM3426 target protein.

The mechanism of the translational inhibition exerted by GAM3426 RNA, herein designated GAM RNA, on one or more GAM3426 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3426 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3426 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3426 RNA, herein designated GAM RNA, of GAM3426 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3426 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3426 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3426 RNA correlate with, and may be deduced from, the identity of the GAM3426 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3431 6804 GGGCGGGGGC Fig. 8 further provides a conceptual description of another novel bioinformatically

CCTCGTCTTA detected oligonucleotides of the present invention, referred to here as Genomic Address

CCCAGCAGTG Messenger 3431 (GAM3431) oligonucleotides modulates expression of respective target genes

TTTGGGTGCG whose function and utility is known in the art.

GTTGGGAGTC GAM3431 is a novel bioinformatically detectable regulatory, non protein coding,

TCTAATACTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM3431 was detected is

CCGGGTAATG described with additional reference to Figs. 9-15.

ATGGAGGCCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CTGTCC encoded by the human genome.

GAM3431 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3431

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3431

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3431 precursor RNA is designated SEQ ID:6804, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6804 is located from position 6952114 to position 6952199 relative to chromosome 12 on the `+` strand.

GAM3431 precursor RNA folds onto itself, forming GAM3431 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3431 precursor RNA, designated SEQ ID NO: 6804, and a schematic representation of a predicted secondary folding of GAM3431 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3431 folded precursor RNA yielding a GAM3431 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3431 RNA, hereby incorporated herein. Expression of GAM3431 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM3431 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3431 target RNA, herein designated GAM TARGET RNA. GAM3431 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3431 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3431 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3431 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3431 RNA, herein designated GAM RNA, to target binding sites on GAM3431 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3431 target RNA into GAM3431 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3431 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3431 target genes. The mRNA of each one of this

plurality of GAM3431 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3431 RNA, herein designated GAM RNA, and which when bound by GAM3431 RNA causes inhibition of translation of the GAM3431 target mRNA into a corresponding GAM3431 target protein.

The mechanism of the translational inhibition exerted by GAM3431 RNA, herein designated GAM RNA, on one or more GAM3431 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3431 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3431 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3431 RNA, herein designated GAM RNA, of GAM3431 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3431 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3431 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3431 RNA correlate with, and may be deduced from, the identity of the GAM3431 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3452 5703 ACTCCAGCCT Fig. 8 further provides a conceptual description of another novel bioinformatically

GGCCTCTGAC detected oligonucleotides of the present invention, referred to here as Genomic Address

CCCAGTTCAA Messenger 3452 (GAM3452) oligonucleotides modulates expression of respective target genes

TCCGACCATG whose function and utility is known in the art.

CCCAAGCCCA GAM3452 is a novel bioinformatically detectable regulatory, non protein coding,

AGCGGGCCTT micro RNA (miRNA)-like oligonucleotide. The method by which GAM3452 was detected is

TCCTCCAGAA described with additional reference to Figs. 9-15.

CTGCTCCGGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GCCTGGCTGT encoded by the human genome.

GT GAM3452 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3452

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3452

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3452 precursor RNA is designated SEQ ID:5703, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5703 is located from position 124136937 to position 124137028 relative to chromosome 9 on the `-` strand.

GAM3452 precursor RNA folds onto itself, forming GAM3452 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3452 precursor RNA, designated SEQ ID NO: 5703, and a schematic representation of a predicted secondary folding of GAM3452 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3452 folded precursor RNA yielding a GAM3452 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3452 RNA, hereby incorporated herein.

GAM3452 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3452 target RNA, herein designated GAM TARGET RNA. GAM3452 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3452 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3452 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3452 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3452 RNA, herein designated GAM RNA, to target binding sites on GAM3452 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3452 target RNA

into GAM3452 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3452 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3452 target genes. The mRNA of each one of this plurality of GAM3452 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3452 RNA, herein designated GAM RNA, and which when bound by GAM3452 RNA causes inhibition of translation of the GAM3452 target mRNA into a corresponding GAM3452 target protein.

The mechanism of the translational inhibition exerted by GAM3452 RNA, herein designated GAM RNA, on one or more GAM3452 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3452 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3452 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3452 RNA, herein designated GAM RNA, of GAM3452 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3452 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3452 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3452 RNA correlate with, and may be deduced from, the identity of the GAM3452 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GGGATGCTGA whose function and utility is known in the art.

GTTATCCACT GAM3479 is a novel bioinformatically detectable regulatory, non protein coding,
GGAGCATCGG micro RNA (miRNA)-like oligonucleotide. The method by which GAM3479 was detected is

CAGTACAGGC described with additional reference to Figs. 9-15.

AGGCACAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GCAGTGGATC encoded by the human genome.

CATCGGAGGT GAM3479 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3479
GGC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3479

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3479 precursor RNA is designated SEQ ID:6877, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6877 is located from position 69762451 to position 69762553 relative to chromosome 16 on the `+` strand.

GAM3479 precursor RNA folds onto itself, forming GAM3479 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3479 precursor RNA, designated SEQ ID NO: 6877, and a schematic representation of a predicted secondary folding of GAM3479 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3479 folded precursor RNA yielding a GAM3479 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3479 RNA, hereby incorporated herein.

GAM3479 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3479 target RNA, herein designated GAM TARGET RNA. GAM3479 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3479 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3479 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3479 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3479 RNA, herein designated GAM RNA, to target binding sites on GAM3479 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3479 target RNA into GAM3479 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3479 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3479 target genes. The mRNA of each one of this plurality of GAM3479 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3479 RNA, herein designated GAM RNA, and which when bound by GAM3479 RNA causes inhibition of translation of the GAM3479 target mRNA into a corresponding GAM3479 target protein.

The mechanism of the translational inhibition exerted by GAM3479 RNA, herein designated GAM RNA, on one or more GAM3479 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3479 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3479 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3479 RNA, herein designated GAM RNA, of GAM3479 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3479 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3479 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3479 RNA correlate with, and may be deduced from, the identity of the GAM3479 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3486 6058 CCAGTTCTCC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTTAGTGTTC detected oligonucleotides of the present invention, referred to here as Genomic Address

AGGCTCAAAT Messenger 3486 (GAM3486) oligonucleotides modulates expression of respective target genes

GAAAGGCCAC whose function and utility is known in the art.

TTTCAGCAAG GAM3486 is a novel bioinformatically detectable regulatory, non protein coding,

TTTTCCTGAC micro RNA (miRNA)-like oligonucleotide. The method by which GAM3486 was detected is

ATTGTCGGAG described with additional reference to Figs. 9-15.

ACTGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM3486 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3486

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3486

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3486 precursor RNA is designated SEQ ID:6058, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6058 is located from position 59248137 to position 59248211 relative to chromosome 20 on the `+` strand.

GAM3486 precursor RNA folds onto itself, forming GAM3486 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3486 precursor RNA, designated SEQ ID NO: 6058, and a schematic representation of a predicted secondary folding of GAM3486 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3486 folded precursor RNA yielding a GAM3486 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3486 RNA, hereby incorporated herein.

GAM3486 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3486 target RNA, herein designated GAM TARGET RNA. GAM3486 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated

region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3486 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3486 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3486 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3486 RNA, herein designated GAM RNA, to target binding sites on GAM3486 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3486 target RNA into GAM3486 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3486 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3486 target genes. The mRNA of each one of this plurality of GAM3486 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3486 RNA, herein designated GAM RNA, and which when bound by GAM3486 RNA causes inhibition of translation of the GAM3486 target mRNA into a corresponding GAM3486 target protein.

The mechanism of the translational inhibition exerted by GAM3486 RNA, herein designated GAM RNA, on one or more GAM3486 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3486 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3486 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3486 RNA, herein designated GAM RNA, of GAM3486 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3486 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3486 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3486 RNA correlate with, and may be deduced from, the identity of the GAM3486 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3513 6284 GAAATGGAGT Fig. 8 further provides a conceptual description of another novel bioinformatically
CTTGCTTTGT detected oligonucleotides of the present invention, referred to here as Genomic Address
CACCGAGGCT Messenger 3513 (GAM3513) oligonucleotides modulates expression of respective target genes
GGAGTGCAGT whose function and utility is known in the art.

GGCATGATCT GAM3513 is a novel bioinformatically detectable regulatory, non protein coding,
CTGCTCACTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM3513 was detected is

CAAGCTCCAC described with additional reference to Figs. 9-15.

CTCCCGGGTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CACGCCATTC encoded by the human genome.

TCCTGCCTC GAM3513 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3513
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3513
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3513 precursor RNA is designated SEQ ID:6284, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6284 is located from position 130044291 to position 130044389 relative to chromosome 11 on the `+` strand.

GAM3513 precursor RNA folds onto itself, forming GAM3513 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3513 precursor RNA, designated SEQ ID NO: 6284, and a schematic representation of a predicted secondary folding of GAM3513 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3513 folded precursor RNA yielding a GAM3513 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3513 RNA, hereby incorporated herein.

GAM3513 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3513 target RNA, herein designated GAM TARGET RNA. GAM3513 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3513 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3513 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3513 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3513 RNA, herein designated GAM RNA, to target binding sites on GAM3513 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3513 target RNA into GAM3513 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3513 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3513 target genes. The mRNA of each one of this plurality of GAM3513 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3513 RNA, herein designated GAM RNA, and which when bound by GAM3513 RNA causes inhibition of translation of the GAM3513 target mRNA into a corresponding GAM3513 target protein.

The mechanism of the translational inhibition exerted by GAM3513 RNA, herein designated GAM RNA, on one or more GAM3513 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3513 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3513 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3513 RNA, herein designated GAM RNA, of GAM3513 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM3513 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3513 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3513 RNA correlate with, and may be deduced from, the identity of the GAM3513 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

AGGCTGCAGT Messenger 3595 (GAM3595) oligonucleotides modulates expression of respective target genes

GTAGTGGCAT whose function and utility is known in the art.

GATCTCGGCT GAM3595 is a novel bioinformatically detectable regulatory, non protein coding,

CACTGCAACC micro RNA (miRNA)-like oligonucleotide. The method by which GAM3595 was detected is

CCCGCCTCCT described with additional reference to Figs. 9-15.

GGGTTCAAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CATTCT encoded by the human genome.

GAM3595 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3595

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3595

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3595 precursor RNA is designated SEQ ID:5736, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5736 is located from position 79670251 to position 79670336 relative to chromosome 14 on the `+` strand.

GAM3595 precursor RNA folds onto itself, forming GAM3595 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3595 precursor RNA, designated SEQ ID NO: 5736, and a schematic representation of a predicted secondary folding of GAM3595 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3595 folded precursor RNA yielding a GAM3595 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3595 RNA, hereby incorporated herein.

GAM3595 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3595 target RNA, herein designated GAM TARGET RNA. GAM3595 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3595 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3595 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3595 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3595 RNA, herein designated GAM RNA, to target binding sites on GAM3595 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3595 target RNA into GAM3595 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3595 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3595 target genes. The mRNA of each one of this plurality of GAM3595 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3595 RNA, herein designated GAM RNA, and which when bound by GAM3595 RNA causes inhibition of translation of the GAM3595 target mRNA into a corresponding GAM3595 target protein.

The mechanism of the translational inhibition exerted by GAM3595 RNA, herein designated GAM RNA, on one or more GAM3595 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3595 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3595 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3595 RNA, herein designated GAM RNA, of GAM3595 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3595 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3595 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3595 RNA correlate with, and may be deduced from, the identity of the GAM3595 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3605 6144 CGGACCCTGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TGTGAGCAGC detected oligonucleotides of the present invention, referred to here as Genomic Address

TCCCTATTCC Messenger 3605 (GAM3605) oligonucleotides modulates expression of respective target genes

ATGACAGTGT whose function and utility is known in the art.

GTTGAGCTCT GAM3605 is a novel bioinformatically detectable regulatory, non protein coding,

CCATTGTCAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM3605 was detected is

AGGCTGGTAG described with additional reference to Figs. 9-15.

GGTGTTCAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TAGAGGTGCC encoded by the human genome.

G GAM3605 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3605

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3605

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3605 precursor RNA is designated SEQ ID:6144, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6144 is located from position 30275106 to position 30275196 relative to chromosome 8 on the `+` strand.

GAM3605 precursor RNA folds onto itself, forming GAM3605 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3605 precursor RNA, designated SEQ ID NO: 6144, and a schematic representation of a predicted secondary folding of GAM3605 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3605 folded precursor RNA yielding a GAM3605 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM3605 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3605 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM3605 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3605 target RNA, herein designated GAM TARGET RNA. GAM3605 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3605 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3605 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3605 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3605 RNA, herein designated GAM RNA, to target binding sites on GAM3605 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3605 target RNA into GAM3605 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3605 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3605 target genes. The mRNA of each one of this plurality of GAM3605 target genes comprises one or more target binding sites, each having

a nucleotide sequence which is at least partly complementary to GAM3605 RNA, herein designated GAM RNA, and which when bound by GAM3605 RNA causes inhibition of translation of the GAM3605 target mRNA into a corresponding GAM3605 target protein.

The mechanism of the translational inhibition exerted by GAM3605 RNA, herein designated GAM RNA, on one or more GAM3605 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3605 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3605 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3605 RNA, herein designated GAM RNA, of GAM3605 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3605 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3605 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3605 RNA correlate with, and may be deduced from, the identity of the GAM3605 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3630 6886 GTCTATTATG Fig. 8 further provides a conceptual description of another novel bioinformatically

AGTCTGACTG detected oligonucleotides of the present invention, referred to here as Genomic Address

GCACAGACAT Messenger 3630 (GAM3630) oligonucleotides modulates expression of respective target genes

CTGTCAAGGA whose function and utility is known in the art.

AGAAGGATTC GAM3630 is a novel bioinformatically detectable regulatory, non protein coding,

TTTGAGCGTA micro RNA (miRNA)-like oligonucleotide. The method by which GAM3630 was detected is

TTTGTGTCAG described with additional reference to Figs. 9-15.

TCAACTGCAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ATATGGAC encoded by the human genome.

GAM3630 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3630

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3630

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3630 precursor RNA is designated SEQ ID:6886, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6886 is located from position 78654898 to position 78654985 relative to chromosome 11 on the `-` strand.

GAM3630 precursor RNA folds onto itself, forming GAM3630 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3630 precursor RNA, designated SEQ ID NO: 6886, and a schematic representation of a predicted secondary folding of GAM3630 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3630 folded precursor RNA yielding a GAM3630 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3630 RNA, hereby incorporated herein.

GAM3630 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3630 target RNA, herein designated GAM TARGET RNA. GAM3630 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3630 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3630 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3630 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3630 RNA, herein designated GAM RNA, to target binding sites on GAM3630 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3630 target RNA into GAM3630 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3630 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3630 target genes. The mRNA of each one of this plurality of GAM3630 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3630 RNA, herein designated GAM RNA, and which when bound by GAM3630 RNA causes inhibition of translation of the GAM3630 target mRNA into a corresponding GAM3630 target protein.

The mechanism of the translational inhibition exerted by GAM3630 RNA, herein designated GAM RNA, on one or more GAM3630 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3630 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3630 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3630 RNA, herein designated GAM RNA, of GAM3630 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3630 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3630 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3630 RNA correlate with, and may be deduced from, the identity of the GAM3630 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3640 6858 GGTTTCCTGG Fig. 8 further provides a conceptual description of another novel bioinformatically

AACTTTGGGG detected oligonucleotides of the present invention, referred to here as Genomic Address

GATCATTATA Messenger 3640 (GAM3640) oligonucleotides modulates expression of respective target genes

AAAATACTAG whose function and utility is known in the art.

GGTAAAAAAG GAM3640 is a novel bioinformatically detectable regulatory, non protein coding,

CAACCTTAGT micro RNA (miRNA)-like oligonucleotide. The method by which GAM3640 was detected is

AATCCCAGCA described with additional reference to Figs. 9-15.

ATTTGGGAGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CC encoded by the human genome.

GAM3640 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3640 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3640 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3640 precursor RNA is designated SEQ ID:6858, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6858 is located from position 47669037 to position 47669118 relative to chromosome 11 on the `-` strand.

GAM3640 precursor RNA folds onto itself, forming GAM3640 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3640 precursor RNA, designated SEQ ID NO: 6858, and a schematic representation of a predicted secondary folding of GAM3640 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3640 folded precursor RNA yielding a GAM3640 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3640 RNA, hereby incorporated herein.

GAM3640 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3640 target RNA, herein designated GAM TARGET RNA. GAM3640 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3640 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3640 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3640 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3640 RNA, herein designated GAM RNA, to target binding sites on GAM3640 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3640 target RNA into GAM3640 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3640 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3640 target genes. CACTTATCAT GAM3747 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3747

CTTCCATTAT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3747

TCTCT precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3747 precursor RNA is designated SEQ ID:5731, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5731 is located from position 117953553 to position 117953667 relative to chromosome 10 on the `-` strand.

GAM3747 precursor RNA folds onto itself, forming GAM3747 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3747 precursor RNA, designated SEQ ID NO: 5731, and a schematic representation of a predicted secondary folding of GAM3747 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3747 folded precursor RNA yielding a GAM3747 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3747 RNA, hereby incorporated herein.

GAM3747 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3747 target RNA, herein designated GAM TARGET RNA. GAM3747 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3747 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3747 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3747 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3747 RNA, herein designated GAM RNA, to target binding sites on GAM3747 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3747 target RNA into GAM3747 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3747 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3747 target genes. The mRNA of each one of this plurality of GAM3747 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3747 RNA, herein designated GAM RNA, and which when bound by GAM3747 RNA causes inhibition of translation of the GAM3747 target mRNA into a corresponding GAM3747 target protein.

The mechanism of the translational inhibition exerted by GAM3747 RNA, herein designated GAM RNA, on one or more GAM3747 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3747 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3747 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3747 RNA, herein designated GAM RNA, of GAM3747 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3747 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3747 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3747 RNA correlate with, and may be deduced from, the identity of the GAM3747 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3768 6947 GTTTGTGGGA Fig. 8 further provides a conceptual description of another novel bioinformatically
GGAGGACTGG detected oligonucleotides of the present invention, referred to here as Genomic Address
CAAAAATATG Messenger 3768 (GAM3768) oligonucleotides modulates expression of respective target genes
AGAGTAGGAG whose function and utility is known in the art.

TTTGGGCTCT GAM3768 is a novel bioinformatically detectable regulatory, non protein coding,
TGAGCTTGGG micro RNA (miRNA)-like oligonucleotide. The method by which GAM3768 was detected is

CCTGGCCTTC described with additional reference to Figs. 9-15.

AAATTTCCAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TCTTTCACTC encoded by the human genome.

ACTAGC GAM3768 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3768
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3768
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3768 precursor RNA is designated SEQ ID:6947, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6947 is located from position 47243042 to position 47243137 relative to chromosome X on the `+` strand.

GAM3768 precursor RNA folds onto itself, forming GAM3768 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3768 precursor RNA, designated SEQ ID NO: 6947, and a schematic representation of a predicted secondary folding of GAM3768 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3768 folded precursor RNA yielding a GAM3768 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the

nucleotide sequence of GAM3768 RNA, hereby incorporated herein.

GAM3768 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3768 target RNA, herein designated GAM TARGET RNA. GAM3768 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3768 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3768 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3768 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3768 RNA, herein designated GAM RNA, to target binding sites on GAM3768 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3768 target RNA into GAM3768 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3768 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3768 target genes. The mRNA of each one of this plurality of GAM3768 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3768 RNA, herein designated GAM RNA, and which when bound by GAM3768 RNA causes inhibition of translation of the GAM3768 target mRNA into a corresponding GAM3768 target protein.

The mechanism of the translational inhibition exerted by GAM3768 RNA, herein designated GAM RNA, on one or more GAM3768 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3768 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3768 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3768 RNA, herein designated GAM RNA, of GAM3768 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3768 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3768 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3768 RNA correlate with, and may be deduced from, the identity of the GAM3768 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3781 6482 GCAAGGTTTG Fig. 8 further provides a conceptual description of another novel bioinformatically

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 3788 (GAM3788) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM3788 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM3788 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM3788 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3788 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3788 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3788 precursor RNA is designated SEQ ID:6006, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6006 is located from position 50069896 to position 50069970 relative to chromosome 12 on the `-` strand.

GAM3788 precursor RNA folds onto itself, forming GAM3788 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3788 precursor RNA, designated SEQ ID NO: 6006, and a

schematic representation of a predicted secondary folding of GAM3788 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3788 folded precursor RNA yielding a GAM3788 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3788 RNA, hereby incorporated herein.

GAM3788 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3788 target RNA, herein designated GAM TARGET RNA. GAM3788 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3788 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3788 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3788 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3788 RNA, herein designated GAM RNA, to target binding sites on GAM3788 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3788 target RNA into GAM3788 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3788 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3788 target genes. The mRNA of each one of this plurality of GAM3788 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3788 RNA, herein designated GAM RNA, and which when bound by GAM3788 RNA causes inhibition of translation of the GAM3788 target mRNA into a corresponding GAM3788 target protein.

The mechanism of the translational inhibition exerted by GAM3788 RNA, herein designated GAM RNA, on one or more GAM3788 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3788 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3788 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3788 RNA, herein designated GAM RNA, of GAM3788 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3788 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3788 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3788 RNA correlate with, and may be deduced from, the identity of the GAM3788 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3890 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3890 target RNA, herein designated GAM TARGET RNA. GAM3890 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3890 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3890 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3890 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3890 RNA, herein designated GAM RNA, to target binding sites on GAM3890 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3890 target RNA into GAM3890 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3890 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3890 target genes. The mRNA of each one of this plurality of GAM3890 target genes comprises one or more target binding sites, each having

a nucleotide sequence which is at least partly complementary to GAM3890 RNA, herein designated GAM RNA, and which when bound by GAM3890 RNA causes inhibition of translation of the GAM3890 target mRNA into a corresponding GAM3890 target protein.

The mechanism of the translational inhibition exerted by GAM3890 RNA, herein designated GAM RNA, on one or more GAM3890 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3890 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3890 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3890 RNA, herein designated GAM RNA, of GAM3890 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3890 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3890 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3890 RNA correlate with, and may be deduced from, the identity of the GAM3890 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3892 6543 GCTGCTGCTG Fig. 8 further provides a conceptual description of another novel bioinformatically

AAGTCACCTG detected oligonucleotides of the present invention, referred to here as Genomic Address

AAAACTCAAC Messenger 3892 (GAM3892) oligonucleotides modulates expression of respective target genes

TAAGCTAAAG whose function and utility is known in the art.

AGCCTAGATG GAM3892 is a novel bioinformatically detectable regulatory, non protein coding,

GGTTACTCAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM3892 was detected is

ATGACTGGCA described with additional reference to Figs. 9-15.

GTGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM3892 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3892

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3892

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3892 precursor RNA is designated SEQ ID:6543, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6543 is located from position 34242096 to position 34242169 relative to chromosome 12 on the `-` strand.

GAM3892 precursor RNA folds onto itself, forming GAM3892 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3892 precursor RNA, designated SEQ ID NO: 6543, and a schematic representation of a predicted secondary folding of GAM3892 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3892 folded precursor RNA yielding a GAM3892 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3892 RNA, hereby incorporated herein.

GAM3892 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3892 target RNA, herein designated GAM TARGET RNA. GAM3892 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3892 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3892 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3892 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3892 RNA, herein designated GAM RNA, to target binding sites on GAM3892 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3892 target RNA into GAM3892 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3892 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3892 target genes. The mRNA of each one of this plurality of GAM3892 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3892 RNA, herein designated GAM RNA, and which when bound by GAM3892 RNA causes inhibition of translation of the GAM3892 target mRNA into a corresponding GAM3892 target protein.

The mechanism of the translational inhibition exerted by GAM3892 RNA, herein designated GAM RNA, on one or more GAM3892 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3892 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3892 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3892 RNA, herein designated GAM RNA, of GAM3892 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3892 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3892 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3892 RNA correlate with, and may be deduced from, the identity of the GAM3892 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM3946 6888 GTCTCTGTTG Fig. 8 further provides a conceptual description of another novel bioinformatically

AGTGCAGTGG Messenger 3946 (GAM3946) oligonucleotides modulates expression of respective target genes

CGCAATCTCA whose function and utility is known in the art.

GCTCACTGCA GAM3946 is a novel bioinformatically detectable regulatory, non protein coding,

ACCTCCACCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM3946 was detected is

CCTGGGTTCA described with additional reference to Figs. 9-15.

AGCGAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM3946 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM3946 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM3946 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM3946 precursor RNA is designated SEQ ID:6888, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6888 is located from position 44652554 to position 44652629 relative to chromosome 11 on the `+` strand.

GAM3946 precursor RNA folds onto itself, forming GAM3946 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM3946 precursor RNA, designated SEQ ID NO: 6888, and a schematic representation of a predicted secondary folding of GAM3946 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM3946 folded precursor RNA yielding a GAM3946 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM3946 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM3946 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM3946 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM3946 target RNA, herein designated GAM TARGET RNA. GAM3946 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM3946 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM3946 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM3946 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM3946 RNA, herein designated GAM RNA, to target binding sites on GAM3946 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM3946 target RNA into GAM3946 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM3946 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM3946 target genes. The mRNA of each one of this plurality of GAM3946 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM3946 RNA, herein designated GAM RNA, and which when bound by GAM3946 RNA causes inhibition of translation of the GAM3946 target mRNA into a corresponding GAM3946 target protein.

The mechanism of the translational inhibition exerted by GAM3946 RNA, herein designated GAM RNA, on one or more GAM3946 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM3946 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM3946 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM3946 RNA, herein designated GAM RNA, of GAM3946 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM3946 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM3946 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM3946 RNA correlate with, and may be deduced from, the identity of the GAM3946 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Nucleotide sequence of GAM4008 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4008 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4008 RNA, herein designated GAM RNA, of GAM4008 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4008 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4008 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4008 RNA correlate with, and may be deduced from, the identity of the GAM4008 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4011 5820 AGTTCAAGGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TGCCTCCTCT detected oligonucleotides of the present invention, referred to here as Genomic Address

CTGTCTTCAT Messenger 4011 (GAM4011) oligonucleotides modulates expression of respective target genes

TATGTGAATT whose function and utility is known in the art.

GAATGTGGTC GAM4011 is a novel bioinformatically detectable regulatory, non protein coding,

ACACATCTGT micro RNA (miRNA)-like oligonucleotide. The method by which GAM4011 was detected is

GTTGGAGCAG described with additional reference to Figs. 9-15.

AGGCAGGGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGCAGCTTTC encoded by the human genome.

AGCT GAM4011 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4011

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4011

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4011 precursor RNA is designated SEQ ID:5820, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5820 is located from position 45149119 to position 45149212 relative to chromosome 22 on the `+` strand.

GAM4011 precursor RNA folds onto itself, forming GAM4011 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4011 precursor RNA, designated SEQ ID NO: 5820, and a schematic representation of a predicted secondary folding of GAM4011 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4011 folded precursor RNA yielding a GAM4011 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4011 RNA, hereby incorporated herein.

GAM4011 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4011 target RNA, herein designated GAM TARGET RNA. GAM4011 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4011 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4011 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4011 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4011 RNA, herein designated GAM RNA, to target binding sites on GAM4011 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4011 target RNA into GAM4011 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4011 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4011 target genes. The mRNA of each one of this plurality of GAM4011 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4011 RNA, herein designated GAM RNA, and which when bound by GAM4011 RNA causes inhibition of translation of the GAM4011 target mRNA into a corresponding GAM4011 target protein.

The mechanism of the translational inhibition exerted by GAM4011 RNA, herein designated GAM RNA, on one or more GAM4011 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4011 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4011 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4011 RNA, herein designated GAM RNA, of GAM4011 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM4011 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4011 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4011 RNA correlate with, and may be deduced from, the identity of the GAM4011 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4020 5670 AAGGTATTTT Fig. 8 further provides a conceptual description of another novel bioinformatically
CTGAGCTGTG detected oligonucleotides of the present invention, referred to here as Genomic Address
AGCCTGCCTT Messenger 4020 (GAM4020) oligonucleotides modulates expression of respective target genes
CCAGTGACAT whose function and utility is known in the art.

GTTCTAAAAA GAM4020 is a novel bioinformatically detectable regulatory, non protein coding,
TTGCAAGTTA micro RNA (miRNA)-like oligonucleotide. The method by which GAM4020 was detected is

TTTGAGGAGG described with additional reference to Figs. 9-15.

CTTTACAGCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AATAGGAAGT encoded by the human genome.

TCTT GAM4020 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4020
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4020
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4020 precursor RNA is designated SEQ ID:5670, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5670 is located from position 62871608 to position 62871701 relative to chromosome 11 on the `-` strand.

GAM4020 precursor RNA folds onto itself, forming GAM4020 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4020 precursor RNA, designated SEQ ID NO: 5670, and a schematic representation of a predicted secondary folding of GAM4020 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4020 folded precursor RNA yielding a GAM4020 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM4020 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4020 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM4020 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4020 target RNA, herein designated GAM TARGET RNA. GAM4020 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4020 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4020 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4020 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4020 RNA, herein designated GAM RNA, to target binding sites on GAM4020 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4020 target RNA into GAM4020 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4020 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4020 target genes. The mRNA of each one of this plurality of GAM4020 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4020 RNA, herein designated GAM RNA, and which when bound by GAM4020 RNA causes inhibition of translation of the GAM4020 target mRNA into a corresponding GAM4020 target protein.

The mechanism of the translational inhibition exerted by GAM4020 RNA, herein designated GAM RNA, on one or more GAM4020 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4020 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4020 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4020 RNA, herein designated GAM RNA, of GAM4020 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4020 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4020 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4020 RNA correlate with, and may be deduced from, the identity of the GAM4020 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4027 7246 TGGGTCCCAG Fig. 8 further provides a conceptual description of another novel bioinformatically

ATTCTTCCTG detected oligonucleotides of the present invention, referred to here as Genomic Address

GTGGAGGCAT Messenger 4027 (GAM4027) oligonucleotides modulates expression of respective target genes

TCGGAGAGCA whose function and utility is known in the art.

ACACCCTGGC GAM4027 is a novel bioinformatically detectable regulatory, non protein coding,

CTTAACACAC micro RNA (miRNA)-like oligonucleotide. The method by which GAM4027 was detected is

TACATATCTT described with additional reference to Figs. 9-15.

TGAATTTCAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACGGGGGCAG encoded by the human genome.

CCTTCTGGGA GAM4027 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4027

AAACCA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4027

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4027 precursor RNA is designated SEQ ID:7246, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7246 is located from position 6197075 to position 6197180 relative to chromosome 17 on the `-` strand.

GAM4027 precursor RNA folds onto itself, forming GAM4027 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4027 precursor RNA, designated SEQ ID NO: 7246, and a

schematic representation of a predicted secondary folding of GAM4027 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4027 folded precursor RNA yielding a GAM4027 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4027 RNA, hereby incorporated herein.

GAM4027 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4027 target RNA, herein designated GAM TARGET RNA. GAM4027 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4027 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4027 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4027 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4027 RNA, herein designated GAM RNA, to target binding sites on GAM4027 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4027 target RNA into GAM4027 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4027 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4027 target genes. The mRNA of each one of this plurality of GAM4027 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4027 RNA, herein designated GAM RNA, and which when bound by GAM4027 RNA causes inhibition of translation of the GAM4027 target mRNA into a corresponding GAM4027 target protein.

The mechanism of the translational inhibition exerted by GAM4027 RNA, herein designated GAM RNA, on one or more GAM4027 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4027 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4027 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4027 RNA, herein designated GAM RNA, of GAM4027 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4027 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4027 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4027 RNA correlate with, and may be deduced from, the identity of the GAM4027 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4064 6077 CCCCAGCCCG Fig. 8 further provides a conceptual description of another novel bioinformatically

GAAGCCTCCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CTATCTCCAG Messenger 4064 (GAM4064) oligonucleotides modulates expression of respective target genes

CCCAGACAAA whose function and utility is known in the art.

CCCTGTGGTC GAM4064 is a novel bioinformatically detectable regulatory, non protein coding,

CAGAGGAGGA micro RNA (miRNA)-like oligonucleotide. The method by which GAM4064 was detected is

ATGAGGGTGC described with additional reference to Figs. 9-15.

AGGGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM4064 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4064

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4064

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4064 precursor RNA is designated SEQ ID:6077, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6077 is located from position 1197566 to position 1197640 relative to chromosome 7 on the `-` strand.

GAM4064 precursor RNA folds onto itself, forming GAM4064 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4064 precursor RNA, designated SEQ ID NO: 6077, and a schematic representation of a predicted secondary folding of GAM4064 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4064 folded precursor RNA yielding a GAM4064 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4064 RNA, hereby incorporated herein.

GAM4064 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4064 target RNA, herein designated GAM TARGET RNA. GAM4064 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4064 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4064 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4064 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4064 RNA, herein designated GAM RNA, to target binding sites on GAM4064 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4064 target RNA into GAM4064 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4064 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4064 target genes. CGGGGTGGAG Messenger 4085 (GAM4085) oligonucleotides modulates expression of respective target genes

CCGCATGGGC whose function and utility is known in the art.

ACCTGGGGGT GAM4085 is a novel bioinformatically detectable regulatory, non protein coding,

GTAGACCGGG micro RNA (miRNA)-like oligonucleotide. The method by which GAM4085 was detected is

GTGGAACTAT described with additional reference to Figs. 9-15.

GTAAACATCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CACACACTCA encoded by the human genome.

GGTGACTT GAM4085 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4085

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4085

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4085 precursor RNA is designated SEQ ID:5766, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5766 is located from position 71416467 to position 71416564 relative to chromosome 11 on the `+` strand.

GAM4085 precursor RNA folds onto itself, forming GAM4085 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4085 precursor RNA, designated SEQ ID NO: 5766, and a schematic representation of a predicted secondary folding of GAM4085 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4085 folded precursor RNA yielding a GAM4085 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4085 RNA, hereby incorporated herein.

GAM4085 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4085 target RNA, herein designated GAM TARGET RNA. GAM4085 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4085 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4085 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4085 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4085 RNA, herein designated GAM RNA, to target binding sites on GAM4085 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4085 target RNA into GAM4085 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4085 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4085 target genes. The mRNA of each one of this plurality of GAM4085 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4085 RNA, herein designated GAM RNA, and which when bound by GAM4085 RNA causes inhibition of translation of the GAM4085 target mRNA into a corresponding GAM4085 target protein.

The mechanism of the translational inhibition exerted by GAM4085 RNA, herein designated GAM RNA, on one or more GAM4085 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4085 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4085 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4085 RNA, herein designated GAM RNA, of GAM4085 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4085 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4085 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4085 RNA correlate with, and may be deduced from, the identity of the GAM4085 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4130 6254 CTTCCATGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
CAGGGGCCAT detected oligonucleotides of the present invention, referred to here as Genomic Address
GACAGGGAGA Messenger 4130 (GAM4130) oligonucleotides modulates expression of respective target genes
TAGGCCACAC whose function and utility is known in the art.

CTTTCCCAGG GAM4130 is a novel bioinformatically detectable regulatory, non protein coding,
TGGAACCTGC micro RNA (miRNA)-like oligonucleotide. The method by which GAM4130 was detected is

AGATGGAGG described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM4130 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4130 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4130 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4130 precursor RNA is designated SEQ ID:6254, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6254 is located from position 77528890 to position 77528958 relative to chromosome X on the `+` strand.

GAM4130 precursor RNA folds onto itself, forming GAM4130 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4130 precursor RNA, designated SEQ ID NO: 6254, and a schematic representation of a predicted secondary folding of GAM4130 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4130 folded precursor RNA yielding a GAM4130 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4130 RNA, hereby incorporated herein.

GAM4130 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4130 target RNA, herein designated GAM TARGET RNA. GAM4130 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4130 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4130 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4130 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4130 RNA, herein designated GAM RNA, to target binding sites on GAM4130 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4130 target RNA into GAM4130 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4130 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4130 target genes. The mRNA of each one of this plurality of GAM4130 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4130 RNA, herein designated GAM RNA, and which when bound by GAM4130 RNA causes inhibition of translation of the GAM4130 target mRNA into a corresponding GAM4130 target protein.

The mechanism of the translational inhibition exerted by GAM4130 RNA, herein designated GAM RNA, on one or more GAM4130 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4130 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4130 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4130 RNA, herein designated GAM RNA, of GAM4130 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4130 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4130 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4130 RNA correlate with, and may be deduced from, the identity of the GAM4130 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4136 5723 AGACGTGGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
TCTCGCTATG detected oligonucleotides of the present invention, referred to here as Genomic Address
TTGGCCAGGT Messenger 4136 (GAM4136) oligonucleotides modulates expression of respective target genes
TGGTCTTGAA whose function and utility is known in the art.

CTCTTGGCCT GAM4136 is a novel bioinformatically detectable regulatory, non protein coding,
CAAGCATTCC micro RNA (miRNA)-like oligonucleotide. The method by which GAM4136 was detected is

TCCTGCCTCA described with additional reference to Figs. 9-15.

GCTTCCCAAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GTGCTAGGAT encoded by the human genome.

TACAGCCATG GAM4136 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4136

AGCCAATAGT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4136

AGTAAAATGA precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar

CTTTTTGTTT to the nucleotide sequence of GAM4136 precursor RNA is designated SEQ ID:5723, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5723 is located from position 58315712 to position 58315841 relative to chromosome 19 on the `-` strand.

GAM4136 precursor RNA folds onto itself, forming GAM4136 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4136 precursor RNA, designated SEQ ID NO: 5723, and a schematic representation of a predicted secondary folding of GAM4136 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4136 folded precursor RNA yielding a GAM4136 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4136 RNA, hereby incorporated herein.

GAM4136 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4136 target RNA, herein designated GAM TARGET RNA. GAM4136 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4136 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4136 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4136 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING

SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4136 RNA, herein designated GAM RNA, to target binding sites on GAM4136 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4136 target RNA into GAM4136 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4136 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4136 target genes. The mRNA of each one of this plurality of GAM4136 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4136 RNA, herein designated GAM RNA, and which when bound by GAM4136 RNA causes inhibition of translation of the GAM4136 target mRNA into a corresponding GAM4136 target protein.

The mechanism of the translational inhibition exerted by GAM4136 RNA, herein designated GAM RNA, on one or more GAM4136 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4136 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4136 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4136 RNA, herein designated GAM RNA, of GAM4136 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4136 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4136 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4136 RNA correlate with, and may be deduced from, the identity of the GAM4136 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

ACTGGAGGGG detected oligonucleotides of the present invention, referred to here as Genomic Address

TTCAAAGATT Messenger 4142 (GAM4142) oligonucleotides modulates expression of respective target genes

CCAGTTCTAA whose function and utility is known in the art.

TATGGGAATG AGCCTCTTTG ATCTCTTCCG GGGCTTTTTC G GAM4142 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM4142 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM4142 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4142 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4142 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4142 precursor RNA is designated SEQ ID:6136, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6136 is located from position 145175426 to position 145175506 relative to chromosome X on the `-` strand.

GAM4142 precursor RNA folds onto itself, forming GAM4142 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4142 precursor RNA, designated SEQ ID NO: 6136, and a schematic representation of a predicted secondary folding of GAM4142 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4142 folded precursor RNA yielding a GAM4142 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4142 RNA, hereby incorporated herein.

GAM4142 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4142 target RNA, herein designated GAM TARGET RNA. GAM4142 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4142 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4142 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4142 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4142 RNA, herein designated GAM RNA, to target binding sites on GAM4142 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4142 target RNA into GAM4142 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4142 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4142 target genes. The mRNA of each one of this plurality of GAM4142 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4142 RNA, herein designated GAM RNA, and which when bound by GAM4142 RNA causes inhibition of translation of the GAM4142 target mRNA into a corresponding GAM4142 target protein.

The mechanism of the translational inhibition exerted by GAM4142 RNA, herein designated GAM RNA, on one or more GAM4142 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4142 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4142 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4142 RNA, herein designated GAM RNA, of GAM4142 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4142 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4142 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4142 RNA correlate with, and may be deduced from, the identity of the GAM4142 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4147 7262 TGTATTGCAG Fig. 8 further provides a conceptual description of another novel bioinformatically

GCCTCAGTAA Messenger 4147 (GAM4147) oligonucleotides modulates expression of respective target genes
ATCTCCATTT whose function and utility is known in the art.

GTAAATGTGA GAM4147 is a novel bioinformatically detectable regulatory, non protein coding,
CAGTCAGCAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM4147 was detected is

AATCTCCAGT described with additional reference to Figs. 9-15.

TACAGTCAAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TCAAAGCAAG encoded by the human genome.

CAGGGGCATG GAM4147 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4147
CCACATACAT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4147
GTTCATATAT precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar
A to the nucleotide sequence of GAM4147 precursor RNA is designated SEQ ID:7262, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7262 is located from position 79828332 to position 79828452 relative to chromosome 14 on the `-` strand.

GAM4147 precursor RNA folds onto itself, forming GAM4147 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4147 precursor RNA, designated SEQ ID NO: 7262, and a schematic representation of a predicted secondary folding of GAM4147 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4147 folded precursor RNA yielding a GAM4147 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4147 RNA, hereby incorporated herein.

GAM4147 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4147 target RNA, herein designated GAM TARGET RNA. GAM4147 target RNA
comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated

region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4147 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4147 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4147 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4147 RNA, herein designated GAM RNA, to target binding sites on GAM4147 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4147 target RNA into GAM4147 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4147 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4147 target genes. The mRNA of each one of this plurality of GAM4147 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4147 RNA, herein designated GAM RNA, and which when bound by GAM4147 RNA causes inhibition of translation of the GAM4147 target mRNA into a corresponding GAM4147 target protein.

The mechanism of the translational inhibition exerted by GAM4147 RNA, herein designated GAM RNA, on one or more GAM4147 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4147 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4147 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4147 RNA, herein designated GAM RNA, of GAM4147 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4147 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4147 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4147 RNA correlate with, and may be deduced from, the identity of the GAM4147 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

AAATACAAGC Messenger 4152 (GAM4152) oligonucleotides modulates expression of respective target genes
AATCATGTAG whose function and utility is known in the art.

TTCACTGTGT GAM4152 is a novel bioinformatically detectable regulatory, non protein coding,
CCATCAGACA micro RNA (miRNA)-like oligonucleotide. The method by which GAM4152 was detected is

GGAACAAATC described with additional reference to Figs. 9-15.

AGATGACCAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAATTGAGAG encoded by the human genome.

ACTGAACATT GAM4152 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4152
TCCTCAGGTG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4152
GCTGGAG precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4152 precursor RNA is designated SEQ ID:6209, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6209 is located from position 25256625 to position 25256741 relative to chromosome 22 on the `+` strand.

GAM4152 precursor RNA folds onto itself, forming GAM4152 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4152 precursor RNA, designated SEQ ID NO: 6209, and a schematic representation of a predicted secondary folding of GAM4152 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4152 folded precursor RNA yielding a GAM4152 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4152 RNA, hereby incorporated herein.

GAM4152 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4152 target RNA, herein designated GAM TARGET RNA. GAM4152 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4152 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4152 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4152 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4152 RNA, herein designated GAM RNA, to target binding sites on GAM4152 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4152 target RNA into GAM4152 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4152 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4152 target genes. The mRNA of each one of this plurality of GAM4152 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4152 RNA, herein designated GAM RNA, and which when bound by GAM4152 RNA causes inhibition of translation of the GAM4152 target mRNA into a corresponding GAM4152 target protein.

The mechanism of the translational inhibition exerted by GAM4152 RNA, herein designated GAM RNA, on one or more GAM4152 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4152 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4152 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4152 RNA, herein designated GAM RNA, of GAM4152 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM4152 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4152 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4152 RNA correlate with, and may be deduced from, the identity of the GAM4152 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4188 5964 ATGACAGCAA Fig. 8 further provides a conceptual description of another novel bioinformatically
GACACTGGCC detected oligonucleotides of the present invention, referred to here as Genomic Address
CTGGAATCCT Messenger 4188 (GAM4188) oligonucleotides modulates expression of respective target genes
CCGTGTCACA whose function and utility is known in the art.

TGTGGGCTGC GAM4188 is a novel bioinformatically detectable regulatory, non protein coding,
TGACAGGAAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM4188 was detected is

AATGTGCTTT described with additional reference to Figs. 9-15.

TGTTGTTGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM4188 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4188

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4188
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4188 precursor RNA is designated SEQ ID:5964, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5964 is located from position 113971971 to position 113972049 relative to chromosome 11 on the `+` strand.

GAM4188 precursor RNA folds onto itself, forming GAM4188 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4188 precursor RNA, designated SEQ ID NO: 5964, and a schematic representation of a predicted secondary folding of GAM4188 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4188 folded precursor RNA yielding a GAM4188 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4188 RNA, hereby incorporated herein.

GAM4188 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4188 target RNA, herein designated GAM TARGET RNA. GAM4188 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4188 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4188 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4188 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4188 RNA, herein designated GAM RNA, to target binding sites on GAM4188 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4188 target RNA into GAM4188 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4188 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4188 target genes. The mRNA of each one of this plurality of GAM4188 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4188 RNA, herein designated GAM RNA, and which when bound by GAM4188 RNA causes inhibition of translation of the GAM4188 target mRNA into a corresponding GAM4188 target protein.

The mechanism of the translational inhibition exerted by GAM4188 RNA, herein designated GAM RNA, on one or more GAM4188 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4188 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4188 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4188 RNA, herein designated GAM RNA, of

GAM4188 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4188 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4188 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4188 RNA correlate with, and may be deduced from, the identity of the GAM4188 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4189 5721 AGACATGTCA Fig. 8 further provides a conceptual description of another novel bioinformatically

AGGCAGGAGC detected oligonucleotides of the present invention, referred to here as Genomic Address

CATCTGATCG Messenger 4189 (GAM4189) oligonucleotides modulates expression of respective target genes

ACCTTAGACT whose function and utility is known in the art.

TGGCAAGCTG GAM4189 is a novel bioinformatically detectable regulatory, non protein coding,

GTGGCTAAGT micro RNA (miRNA)-like oligonucleotide. The method by which GAM4189 was detected is

CCAGTGCTCA described with additional reference to Figs. 9-15.

CTGCCGACAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CTGTCT encoded by the human genome.

GAM4189 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4189

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4189

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4189 precursor RNA is designated SEQ ID:5721, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5721 is located from position 32944216 to position 32944301 relative to chromosome 19 on the `-` strand.

GAM4189 precursor RNA folds onto itself, forming GAM4189 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4189 precursor RNA, designated SEQ ID NO: 5721, and a schematic representation of a predicted secondary folding of GAM4189 folded precursor RNA,

herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4189 folded precursor RNA yielding a GAM4189 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4189 RNA, hereby incorporated herein.

GAM4189 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4189 target RNA, herein designated GAM TARGET RNA. GAM4189 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4189 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4189 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4189 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4189 RNA, herein designated GAM RNA, to target binding sites on GAM4189 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4189 target RNA into GAM4189 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4189 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4189 target genes. The mRNA of each one of this plurality of GAM4189 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4189 RNA, herein designated GAM RNA, and which when bound by GAM4189 RNA causes inhibition of translation of the GAM4189 target mRNA into a corresponding GAM4189 target protein.

The mechanism of the translational inhibition exerted by GAM4189 RNA, herein designated GAM RNA, on one or more GAM4189 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4189 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM4189 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4189 RNA, herein designated GAM RNA, of GAM4189 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4189 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4189 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4189 RNA correlate with, and may be deduced from, the identity of the GAM4189 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4199 6228 CTGGCTGCTC Fig. 8 further provides a conceptual description of another novel bioinformatically

CTCTCCATGT detected oligonucleotides of the present invention, referred to here as Genomic Address

ACCCATTCCC Messenger 4199 (GAM4199) oligonucleotides modulates expression of respective target genes

CTTGGGGTGC whose function and utility is known in the art.

AAGCCACACC GAM4199 is a novel bioinformatically detectable regulatory, non protein coding,

ACCCTTCACT micro RNA (miRNA)-like oligonucleotide. The method by which GAM4199 was detected is

TGGGGGATGA described with additional reference to Figs. 9-15.

TAGCAGCCAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM4199 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4199

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4199

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4199 precursor RNA is designated SEQ ID:6228, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6228 is located from position 35997845 to position 35997924 relative to chromosome 22 on the `-` strand.

GAM4199 precursor RNA folds onto itself, forming GAM4199 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4199 precursor RNA, designated SEQ ID NO: 6228, and a schematic representation of a predicted secondary folding of GAM4199 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4199 folded precursor RNA yielding a GAM4199 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM4199 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4199 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM4199 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4199 target RNA, herein designated GAM TARGET RNA. GAM4199 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4199 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4199 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4199 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4199 RNA, herein designated GAM RNA, to target binding sites on GAM4199 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4199 target RNA into GAM4199 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4199 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4199 target genes. The mRNA of each one of this plurality of GAM4199 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4199 RNA, herein designated GAM RNA, and which when bound by GAM4199 RNA causes inhibition of translation of the GAM4199 target mRNA into a corresponding GAM4199 target protein.

The mechanism of the translational inhibition exerted by GAM4199 RNA, herein

designated GAM RNA, on one or more GAM4199 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4199 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4199 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4199 RNA, herein designated GAM RNA, of GAM4199 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4199 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4199 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4199 RNA correlate with, and may be deduced from, the identity of the GAM4199 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4205 6549 GCTGTCAGAT Fig. 8 further provides a conceptual description of another novel bioinformatically

CAGGTTCCTG detected oligonucleotides of the present invention, referred to here as Genomic Address

ATTGGAGTTC Messenger 4205 (GAM4205) oligonucleotides modulates expression of respective target genes

TCTTATCTGC whose function and utility is known in the art.

TCTGGTTTGG GAM4205 is a novel bioinformatically detectable regulatory, non protein coding,

AGGGCTGCCC micro RNA (miRNA)-like oligonucleotide. The method by which GAM4205 was detected is

CATTCGGGAA described with additional reference to Figs. 9-15.

TCTGTTTTGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTTGC encoded by the human genome.

GAM4205 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4205

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4205

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4205 precursor RNA is designated SEQ ID:6549, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6549 is located from position 110102091 to position 110102175 relative to chromosome 13

on the `-` strand.

GAM4205 precursor RNA folds onto itself, forming GAM4205 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4205 precursor RNA, designated SEQ ID NO: 6549, and a schematic representation of a predicted secondary folding of GAM4205 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4205 folded precursor RNA yielding a GAM4205 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4205 RNA, hereby incorporated herein.

GAM4205 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4205 target RNA, herein designated GAM TARGET RNA. GAM4205 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4205 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4205 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4205 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4205 RNA, herein designated GAM RNA, to target binding sites on GAM4205 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4205 target RNA into GAM4205 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4205 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4205 target genes. The mRNA of each one of this plurality of GAM4205 target genes comprises one or more target binding sites, each having

a nucleotide sequence which is at least partly complementary to GAM4205 RNA, herein designated GAM RNA, and which when bound by GAM4205 RNA causes inhibition of translation of the GAM4205 target mRNA into a corresponding GAM4205 target protein.

The mechanism of the translational inhibition exerted by GAM4205 RNA, herein designated GAM RNA, on one or more GAM4205 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4205 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4205 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4205 RNA, herein designated GAM RNA, of GAM4205 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4205 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4205 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4205 RNA correlate with, and may be deduced from, the identity of the GAM4205 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4238 6167 CTCCTGTAGT Fig. 8 further provides a conceptual description of another novel bioinformatically

CCTAGAGCGT detected oligonucleotides of the present invention, referred to here as Genomic Address

TTCTCTTGAA Messenger 4238 (GAM4238) oligonucleotides modulates expression of respective target genes

CCCTAATTTT whose function and utility is known in the art.

TAGGTCTCAA GAM4238 is a novel bioinformatically detectable regulatory, non protein coding,

AGAGTGGGCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM4238 was detected is

TCAGAGATAA described with additional reference to Figs. 9-15.

AGAGGTTTAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GCAGGGACAG encoded by the human genome.

GGCGAGGAG GAM4238 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4238

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4238

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4238 precursor RNA is designated SEQ ID:6167, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6167 is located from position 42216969 to position 42217067 relative to chromosome 9 on the `-` strand.

GAM4238 precursor RNA folds onto itself, forming GAM4238 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4238 precursor RNA, designated SEQ ID NO: 6167, and a schematic representation of a predicted secondary folding of GAM4238 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4238 folded precursor RNA yielding a GAM4238 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4238 RNA, hereby incorporated herein.

GAM4238 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4238 target RNA, herein designated GAM TARGET RNA. GAM4238 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4238 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4238 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4238 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4238 RNA, herein designated GAM RNA, to target binding sites on GAM4238 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4238 target RNA into GAM4238 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4238 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4238 target genes. The mRNA of each one of this plurality of GAM4238 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4238 RNA, herein designated GAM RNA, and which when bound by GAM4238 RNA causes inhibition of translation of the GAM4238 target mRNA into a corresponding GAM4238 target protein.

The mechanism of the translational inhibition exerted by GAM4238 RNA, herein designated GAM RNA, on one or more GAM4238 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4238 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4238 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4238 RNA, herein designated GAM RNA, of GAM4238 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4238 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4238 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4238 RNA correlate with, and may be deduced from, the identity of the GAM4238 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4243 5650 AAAGGCAGAC Fig. 8 further provides a conceptual description of another novel bioinformatically

GGTGAATGCC detected oligonucleotides of the present invention, referred to here as Genomic Address

TTGAGAAATT Messenger 4243 (GAM4243) oligonucleotides modulates expression of respective target genes

GTTCAGATTC whose function and utility is known in the art.

AAGGACAAGC GAM4243 is a novel bioinformatically detectable regulatory, non protein coding,

ATTTGTTGCC micro RNA (miRNA)-like oligonucleotide. The method by which GAM4243 was detected is

TTT described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM4243 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4243 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4243 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4243 precursor RNA is designated SEQ ID:5650, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5650 is located from position 62347057 to position 62347119 relative to chromosome 15 on the `+` strand.

GAM4243 precursor RNA folds onto itself, forming GAM4243 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4243 precursor RNA, designated SEQ ID NO: 5650, and a schematic representation of a predicted secondary folding of GAM4243 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4243 folded precursor RNA yielding a GAM4243 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4243 RNA, hereby incorporated herein.

GAM4243 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4243 target RNA, herein designated GAM TARGET RNA. GAM4243 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4243 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4243 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4243 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4243 RNA, herein designated GAM RNA, to target binding sites on GAM4243 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4243 target RNA into GAM4243 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4243 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4243 target genes. The mRNA of each one of this plurality of GAM4243 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4243 RNA, herein designated GAM RNA, and which when bound by GAM4243 RNA causes inhibition of translation of the GAM4243 target mRNA into a corresponding GAM4243 target protein.

The mechanism of the translational inhibition exerted by GAM4243 RNA, herein designated GAM RNA, on one or more GAM4243 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4243 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4243 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4243 RNA, herein designated GAM RNA, of GAM4243 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4243 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4243 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4243 RNA correlate with, and may be deduced from, the identity of the GAM4243 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4298 6898 GTGAGGCTCT GGCAAGGTGT GGGCTAGAGA TGCGACTCAG TTGGATCTAT CTCTCAGAAG

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 4298 (GAM4298) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM4298 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM4298 was detected is

GCTACCTTGT described with additional reference to Figs. 9-15.

AAGTAGAGTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CCAC encoded by the human genome.

GAM4298 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4298 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4298 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4298 precursor RNA is designated SEQ ID:6898, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6898 is located from position 111675686 to position 111675769 relative to chromosome 12 on the `-` strand.

GAM4298 precursor RNA folds onto itself, forming GAM4298 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4298 precursor RNA, designated SEQ ID NO: 6898, and a schematic representation of a predicted secondary folding of GAM4298 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4298 folded precursor RNA yielding a GAM4298 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4298 RNA, hereby incorporated herein.

GAM4298 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4298 target RNA, herein designated GAM TARGET RNA. GAM4298 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4298 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4298 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4298 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4298 RNA, herein designated GAM RNA, to target binding sites on GAM4298 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4298 target RNA into GAM4298 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4298 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4298 target genes. The mRNA of each one of this plurality of GAM4298 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4298 RNA, herein designated GAM RNA, and which when bound by GAM4298 RNA causes inhibition of translation of the GAM4298 target mRNA into a corresponding GAM4298 target protein.

The mechanism of the translational inhibition exerted by GAM4298 RNA, herein designated GAM RNA, on one or more GAM4298 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4298 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4298 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4298 RNA, herein designated GAM RNA, of GAM4298 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4298 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4298 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4298 RNA correlate with, and may be deduced from, the identity of the GAM4298 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4315 6015 CAGATTGCAC GAACATTTCA TTTTTCACAC

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 4315 (GAM4315) oligonucleotides modulates expression of respective target genes

AGGGTCACCA whose function and utility is known in the art.

GAATACCATC GAM4315 is a novel bioinformatically detectable regulatory, non protein coding,
AATTTTTTGG micro RNA (miRNA)-like oligonucleotide. The method by which GAM4315 was detected is

TATCACTGTC described with additional reference to Figs. 9-15.

AAAAGTGATC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CTAGCACCTT encoded by the human genome.

CTGAAATAAC GAM4315 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4315
GTGAGCTG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4315
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4315 precursor RNA is designated SEQ ID:6015, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6015 is located from position 75288703 to position 75288810 relative to chromosome 16 on the `+` strand.

GAM4315 precursor RNA folds onto itself, forming GAM4315 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4315 precursor RNA, designated SEQ ID NO: 6015, and a schematic representation of a predicted secondary folding of GAM4315 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4315 folded precursor RNA yielding a GAM4315 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4315 RNA, hereby incorporated herein.

GAM4315 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4315 target RNA, herein designated GAM TARGET RNA. GAM4315 target RNA
comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4315 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4315 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4315 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4315 RNA, herein designated GAM RNA, to target binding sites on GAM4315 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4315 target RNA into GAM4315 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4315 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4315 target genes. The mRNA of each one of this plurality of GAM4315 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4315 RNA, herein designated GAM RNA, and which when bound by GAM4315 RNA causes inhibition of translation of the GAM4315 target mRNA into a corresponding GAM4315 target protein.

The mechanism of the translational inhibition exerted by GAM4315 RNA, herein designated GAM RNA, on one or more GAM4315 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4315 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4315 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4315 RNA, herein designated GAM RNA, of GAM4315 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4315 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4315 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4315 RNA correlate with, and may be deduced from, the identity of the GAM4315 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4364 5678 AATGTTCTGG Fig. 8 further provides a conceptual description of another novel bioinformatically

CACATAGTAA detected oligonucleotides of the present invention, referred to here as Genomic Address

TTAATTAAGA Messenger 4364 (GAM4364) oligonucleotides modulates expression of respective target genes

AAATCGAGCA whose function and utility is known in the art.

CCCTTAATTA GAM4364 is a novel bioinformatically detectable regulatory, non protein coding,

CCTAGAATGC micro RNA (miRNA)-like oligonucleotide. The method by which GAM4364 was detected is

AGGGTTGTTA described with additional reference to Figs. 9-15.

GTTTTTTGGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGACTTTTGT encoded by the human genome.

TTTGCTGGGG GAM4364 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4364

CATT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4364

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4364 precursor RNA is designated SEQ ID:5678, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5678 is located from position 98918395 to position 98918498 relative to chromosome X on the `+` strand.

GAM4364 precursor RNA folds onto itself, forming GAM4364 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4364 precursor RNA, designated SEQ ID NO: 5678, and a schematic representation of a predicted secondary folding of GAM4364 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4364 folded precursor RNA yielding a GAM4364 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4364 RNA, hereby incorporated herein.

GAM4364 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4364 target RNA, herein designated GAM TARGET RNA. GAM4364 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated

region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4364 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4364 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4364 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4364 RNA, herein designated GAM RNA, to target binding sites on GAM4364 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4364 target RNA into GAM4364 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4364 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4364 target genes. The mRNA of each one of this plurality of GAM4364 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4364 RNA, herein designated GAM RNA, and which when bound by GAM4364 RNA causes inhibition of translation of the GAM4364 target mRNA into a corresponding GAM4364 target protein.

The mechanism of the translational inhibition exerted by GAM4364 RNA, herein designated GAM RNA, on one or more GAM4364 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4364 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4364 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4364 RNA, herein designated GAM RNA, of GAM4364 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4364 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4364 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4364 RNA correlate with, and may be deduced from, the identity of the GAM4364 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GTAGAGGTTG whose function and utility is known in the art.

CAGTGAGTCA GAM4376 is a novel bioinformatically detectable regulatory, non protein coding,

AGATCATGCC micro RNA (miRNA)-like oligonucleotide. The method by which GAM4376 was detected is

ATTGCACTCC described with additional reference to Figs. 9-15.

AACCTGGGCG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACAAGAGCAA encoded by the human genome.

AACTCTGTCT GAM4376 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4376

C precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4376

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4376 precursor RNA is designated SEQ ID:6380, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6380 is located from position 182465 to position 182565 relative to chromosome 18 on the `+` strand.

GAM4376 precursor RNA folds onto itself, forming GAM4376 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4376 precursor RNA, designated SEQ ID NO: 6380, and a schematic representation of a predicted secondary folding of GAM4376 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4376 folded precursor RNA yielding a GAM4376 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4376 RNA, hereby incorporated herein.

GAM4376 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4376 target RNA, herein designated GAM TARGET RNA. GAM4376 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4376 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4376 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4376 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4376 RNA, herein designated GAM RNA, to target binding sites on GAM4376 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4376 target RNA into GAM4376 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4376 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4376 target genes. The mRNA of each one of this plurality of GAM4376 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4376 RNA, herein designated GAM RNA, and which when bound by GAM4376 RNA causes inhibition of translation of the GAM4376 target mRNA into a corresponding GAM4376 target protein.

The mechanism of the translational inhibition exerted by GAM4376 RNA, herein designated GAM RNA, on one or more GAM4376 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4376 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4376 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4376 RNA, herein designated GAM RNA, of GAM4376 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

AAGGAGCGAG GAM4377 is a novel bioinformatically detectable regulatory, non protein coding,
GAGCAGTTTC micro RNA (miRNA)-like oligonucleotide. The method by which GAM4377 was detected is

CTGGAAGCCC described with additional reference to Figs. 9-15.

TGGGCTGGTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTTGACTTGC encoded by the human genome.

TTTGAGATAG GAM4377 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4377
AATAAATGGG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4377
A precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4377 precursor RNA is designated SEQ ID:7031, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7031 is located from position 49418894 to position 49419004 relative to chromosome 20 on the `-` strand.

GAM4377 precursor RNA folds onto itself, forming GAM4377 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4377 precursor RNA, designated SEQ ID NO: 7031, and a schematic representation of a predicted secondary folding of GAM4377 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4377 folded precursor RNA yielding a GAM4377 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM4377 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4377 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM4377 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4377 target RNA, herein designated GAM TARGET RNA. GAM4377 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4377 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4377 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4377 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4377 RNA, herein designated GAM RNA, to target binding sites on GAM4377 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4377 target RNA into GAM4377 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4377 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4377 target genes. The mRNA of each one of this plurality of GAM4377 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4377 RNA, herein designated GAM RNA, and which when bound by GAM4377 RNA causes inhibition of translation of the GAM4377 target mRNA into a corresponding GAM4377 target protein.

The mechanism of the translational inhibition exerted by GAM4377 RNA, herein designated GAM RNA, on one or more GAM4377 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4377 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4377 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4377 RNA, herein designated GAM RNA, of GAM4377 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4377 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4377 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4377 RNA correlate with, and may be deduced from, the identity of the GAM4377 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4382 6038 CATCAGCTAT Fig. 8 further provides a conceptual description of another novel bioinformatically

TCCTGTTCTA detected oligonucleotides of the present invention, referred to here as Genomic Address

GAAAGGGCAC Messenger 4382 (GAM4382) oligonucleotides modulates expression of respective target genes

TCTGGCTGCA whose function and utility is known in the art.

ATGTGGAGGA GAM4382 is a novel bioinformatically detectable regulatory, non protein coding,

GGGAGTGACT micro RNA (miRNA)-like oligonucleotide. The method by which GAM4382 was detected is

GGAGGAAGGG described with additional reference to Figs. 9-15.

AGGTAAGTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM4382 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4382

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4382

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4382 precursor RNA is designated SEQ ID:6038, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6038 is located from position 98489976 to position 98490054 relative to chromosome 10 on the `+` strand.

GAM4382 precursor RNA folds onto itself, forming GAM4382 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4382 precursor RNA, designated SEQ ID NO: 6038, and a

schematic representation of a predicted secondary folding of GAM4382 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4382 folded precursor RNA yielding a GAM4382 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4382 RNA, hereby incorporated herein.

GAM4382 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4382 target RNA, herein designated GAM TARGET RNA. GAM4382 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4382 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4382 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4382 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4382 RNA, herein designated GAM RNA, to target binding sites on GAM4382 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4382 target RNA into GAM4382 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4382 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4382 target genes. The mRNA of each one of this plurality of GAM4382 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4382 RNA, herein designated GAM RNA, and which when bound by GAM4382 RNA causes inhibition of translation of the GAM4382 target mRNA into a corresponding GAM4382 target protein.

The mechanism of the translational inhibition exerted by GAM4382 RNA, herein designated GAM RNA, on one or more GAM4382 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4382 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4382 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4382 RNA, herein designated GAM RNA, of GAM4382 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4382 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4382 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4382 RNA correlate with, and may be deduced from, the identity of the GAM4382 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4398 7254 TGGTGGGACA Fig. 8 further provides a conceptual description of another novel bioinformatically

CAGAGCCAGT detected oligonucleotides of the present invention, referred to here as Genomic Address

GACTGACATA Messenger 4398 (GAM4398) oligonucleotides modulates expression of respective target genes

GAAGAGCAGT whose function and utility is known in the art.

GGGGTAGAAT GAM4398 is a novel bioinformatically detectable regulatory, non protein coding,

TACAGTTCCA micro RNA (miRNA)-like oligonucleotide. The method by which GAM4398 was detected is

TCTGGTGCCT described with additional reference to Figs. 9-15.

TTTCTCTGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAAAGCTGTA encoded by the human genome.

TCCATCACCA GAM4398 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4398

CCA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4398

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4398 precursor RNA is designated SEQ ID:7254, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7254 is located from position 50452834 to position 50452936 relative to chromosome 16 on the `+` strand.

GAM4398 precursor RNA folds onto itself, forming GAM4398 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4398 precursor RNA, designated SEQ ID NO: 7254, and a schematic representation of a predicted secondary folding of GAM4398 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4398 folded precursor RNA yielding a GAM4398 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4398 RNA, hereby incorporated herein.

GAM4398 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4398 target RNA, herein designated GAM TARGET RNA. GAM4398 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4398 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4398 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4398 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4398 RNA, herein designated GAM RNA, to target binding sites on GAM4398 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4398 target RNA into GAM4398 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4398 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4398 target genes. The mRNA of each one of this plurality of GAM4398 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4398 RNA, herein designated GAM RNA, and which when bound by GAM4398 RNA causes inhibition of translation of the GAM4398 target mRNA into a corresponding GAM4398 target protein.

The mechanism of the translational inhibition exerted by GAM4398 RNA, herein

designated GAM RNA, on one or more GAM4398 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4398 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4398 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4398 RNA, herein designated GAM RNA, of GAM4398 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4398 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4398 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4398 RNA correlate with, and may be deduced from, the identity of the GAM4398 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4408 5801 AGTATCTGGA Fig. 8 further provides a conceptual description of another novel bioinformatically
ATTCTATTGT detected oligonucleotides of the present invention, referred to here as Genomic Address
GTGTGAGTCT Messenger 4408 (GAM4408) oligonucleotides modulates expression of respective target genes
GTGCAGGAAC whose function and utility is known in the art.

ACAATGAGTC GAM4408 is a novel bioinformatically detectable regulatory, non protein coding,
TCAAAGTGAA micro RNA (miRNA)-like oligonucleotide. The method by which GAM4408 was detected is

AAAAACTTTG described with additional reference to Figs. 9-15.

GATTCCTGGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TCCTACAGCA encoded by the human genome.

CTTTTGTTCA GAM4408 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4408
GATACT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4408
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4408 precursor RNA is designated SEQ ID:5801, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5801 is located from position 138777302 to position 138777407 relative to chromosome 8

on the `-` strand.

GAM4408 precursor RNA folds onto itself, forming GAM4408 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4408 precursor RNA, designated SEQ ID NO: 5801, and a schematic representation of a predicted secondary folding of GAM4408 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4408 folded precursor RNA yielding a GAM4408 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4408 RNA, hereby incorporated herein.

GAM4408 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4408 target RNA, herein designated GAM TARGET RNA. GAM4408 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4408 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4408 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4408 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4408 RNA, herein designated GAM RNA, to target binding sites on GAM4408 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4408 target RNA into GAM4408 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4408 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4408 target genes. The mRNA of each one of this plurality of GAM4408 target genes comprises one or more target binding sites, each having

a nucleotide sequence which is at least partly complementary to GAM4408 RNA, herein designated GAM RNA, and which when bound by GAM4408 RNA causes inhibition of translation of the GAM4408 target mRNA into a corresponding GAM4408 target protein.

The mechanism of the translational inhibition exerted by GAM4408 RNA, herein designated GAM RNA, on one or more GAM4408 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4408 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4408 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4408 RNA, herein designated GAM RNA, of GAM4408 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4408 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4408 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4408 RNA correlate with, and may be deduced from, the identity of the GAM4408 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GTGACATTGA Messenger 4423 (GAM4423) oligonucleotides modulates expression of respective target genes
CATTGACAGC whose function and utility is known in the art.

ATGAAAATGG GAM4423 is a novel bioinformatically detectable regulatory, non protein coding,
GTCTTGCCAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM4423 was detected is

TGCATGTGAG described with additional reference to Figs. 9-15.

ACTGCCTCCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AACACTCAGC encoded by the human genome.

GAM4423 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4423

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4423

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4423 precursor RNA is designated SEQ ID:6541, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6541 is located from position 40086542 to position 40086631 relative to chromosome 17 on the `+` strand.

GAM4423 precursor RNA folds onto itself, forming GAM4423 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4423 precursor RNA, designated SEQ ID NO: 6541, and a schematic representation of a predicted secondary folding of GAM4423 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4423 folded precursor RNA yielding a GAM4423 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4423 RNA, hereby incorporated herein.

GAM4423 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4423 target RNA, herein designated GAM TARGET RNA. GAM4423 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4423 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4423 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4423 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4423 RNA, herein designated GAM RNA, to target binding sites on GAM4423 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4423 target RNA into GAM4423 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4423 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4423 target genes. The mRNA of each one of this plurality of GAM4423 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4423 RNA, herein designated GAM RNA, and which when bound by GAM4423 RNA causes inhibition of translation of the GAM4423 target mRNA into a corresponding GAM4423 target protein.

The mechanism of the translational inhibition exerted by GAM4423 RNA, herein designated GAM RNA, on one or more GAM4423 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4423 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4423 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4423 RNA, herein designated GAM RNA, of GAM4423 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4423 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4423 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4423 RNA correlate with, and may be deduced from, the identity of the GAM4423 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4426 7338 TTGTGGATAT Fig. 8 further provides a conceptual description of another novel bioinformatically

TGAAGTTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

AGCCTGTTGT Messenger 4426 (GAM4426) oligonucleotides modulates expression of respective target genes

TCATCTATAG whose function and utility is known in the art.

ATGCACTGGA GAM4426 is a novel bioinformatically detectable regulatory, non protein coding,

TGGGATTGGA micro RNA (miRNA)-like oligonucleotide. The method by which GAM4426 was detected is

AGTCTTCAGA described with additional reference to Figs. 9-15.

TTTCAGTAGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GTTTTCCACA encoded by the human genome.

A GAM4426 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4426 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4426 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4426 precursor RNA is designated SEQ ID:7338, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7338 is located from position 77432988 to position 77433078 relative to chromosome 1 on the `-` strand.

GAM4426 precursor RNA folds onto itself, forming GAM4426 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4426 precursor RNA, designated SEQ ID NO: 7338, and a schematic representation of a predicted secondary folding of GAM4426 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4426 folded precursor RNA yielding a GAM4426 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4426 RNA, hereby incorporated herein. Expression of GAM4426 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM4426 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4426 target RNA, herein designated GAM TARGET RNA. GAM4426 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4426 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4426 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4426 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region

or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4426 RNA, herein designated GAM RNA, to target binding sites on GAM4426 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4426 target RNA into GAM4426 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4426 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4426 target genes. The mRNA of each one of this plurality of GAM4426 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4426 RNA, herein designated GAM RNA, and which when bound by GAM4426 RNA causes inhibition of translation of the GAM4426 target mRNA into a corresponding GAM4426 target protein.

The mechanism of the translational inhibition exerted by GAM4426 RNA, herein designated GAM RNA, on one or more GAM4426 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4426 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4426 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4426 RNA, herein designated GAM RNA, of GAM4426 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4426 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4426 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4426 RNA correlate with, and may be deduced from, the identity of the GAM4426 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4429 6914 GTGGCTCGAC Fig. 8 further provides a conceptual description of another novel bioinformatically
TCTTGACCAT detected oligonucleotides of the present invention, referred to here as Genomic Address
GGCTGGGGTT Messenger 4429 (GAM4429) oligonucleotides modulates expression of respective target genes
CCTGAGGATG whose function and utility is known in the art.

AGCTAAACCC GAM4429 is a novel bioinformatically detectable regulatory, non protein coding,

TTTCCATGTA micro RNA (miRNA)-like oligonucleotide. The method by which GAM4429 was detected is

CTGGGGGTTG described with additional reference to Figs. 9-15.

AGGCCAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM4429 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4429

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4429

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4429 precursor RNA is designated SEQ ID:6914, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6914 is located from position 55937832 to position 55937908 relative to chromosome 12 on the `-` strand.

GAM4429 precursor RNA folds onto itself, forming GAM4429 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4429 precursor RNA, designated SEQ ID NO: 6914, and a schematic representation of a predicted secondary folding of GAM4429 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4429 folded precursor RNA yielding a GAM4429 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4429 RNA, hereby incorporated herein.

GAM4429 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4429 target RNA, herein designated GAM TARGET RNA. GAM4429 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4429 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4429 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4429 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows

three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4429 RNA, herein designated GAM RNA, to target binding sites on GAM4429 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4429 target RNA into GAM4429 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4429 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4429 target genes. The mRNA of each one of this plurality of GAM4429 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4429 RNA, herein designated GAM RNA, and which when bound by GAM4429 RNA causes inhibition of translation of the GAM4429 target mRNA into a corresponding GAM4429 target protein.

The mechanism of the translational inhibition exerted by GAM4429 RNA, herein designated GAM RNA, on one or more GAM4429 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4429 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4429 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4429 RNA, herein designated GAM RNA, of GAM4429 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4429 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4429 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4429 RNA correlate with, and may be deduced from, the identity of the GAM4429 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4432 5986 CAACAGGTGC AAGTGTTAAA Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address

GGGTATGATC Messenger 4432 (GAM4432) oligonucleotides modulates expression of respective target genes

CTTCAGTGGA whose function and utility is known in the art.

ACAAAGCCTC GAM4432 is a novel bioinformatically detectable regulatory, non protein coding, CGTGTCACCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM4432 was detected is

GAGGGATAGC described with additional reference to Figs. 9-15.

AACATGCCTA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAAGCACTGC encoded by the human genome.

AAGAGTTG GAM4432 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4432 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4432 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4432 precursor RNA is designated SEQ ID:5986, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5986 is located from position 27028798 to position 27028895 relative to chromosome 9 on the `+` strand.

GAM4432 precursor RNA folds onto itself, forming GAM4432 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4432 precursor RNA, designated SEQ ID NO: 5986, and a schematic representation of a predicted secondary folding of GAM4432 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4432 folded precursor RNA yielding a GAM4432 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4432 RNA, hereby incorporated herein.

GAM4432 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4432 target RNA, herein designated GAM TARGET RNA. GAM4432 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4432 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4432 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4432 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4432 RNA, herein designated GAM RNA, to target binding sites on GAM4432 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4432 target RNA into GAM4432 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4432 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4432 target genes. The mRNA of each one of this plurality of GAM4432 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4432 RNA, herein designated GAM RNA, and which when bound by GAM4432 RNA causes inhibition of translation of the GAM4432 target mRNA into a corresponding GAM4432 target protein.

The mechanism of the translational inhibition exerted by GAM4432 RNA, herein designated GAM RNA, on one or more GAM4432 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4432 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4432 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4432 RNA, herein designated GAM RNA, of GAM4432 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4432 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4432 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4432 RNA correlate with, and may be deduced from, the identity of the GAM4432 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4446 7024 TCCCACAGTC Fig. 8 further provides a conceptual description of another novel bioinformatically

GGGAGGAAAA detected oligonucleotides of the present invention, referred to here as Genomic Address

GAAAGAAGAC Messenger 4446 (GAM4446) oligonucleotides modulates expression of respective target genes

TCTGTTGTTC whose function and utility is known in the art.

ATTGTTTTTA GAM4446 is a novel bioinformatically detectable regulatory, non protein coding,

TCTTTTTCTC micro RNA (miRNA)-like oligonucleotide. The method by which GAM4446 was detected is

CAGATGCCTG described with additional reference to Figs. 9-15.

TGGGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM4446 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4446

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4446

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4446 precursor RNA is designated SEQ ID:7024, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7024 is located from position 117986909 to position 117986983 relative to chromosome X on the `-` strand.

GAM4446 precursor RNA folds onto itself, forming GAM4446 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4446 precursor RNA, designated SEQ ID NO: 7024, and a schematic representation of a predicted secondary folding of GAM4446 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4446 folded precursor RNA yielding a GAM4446 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM4446 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4446 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM4446 target gene, herein designated GAM TARGET GENE, encodes a corresponding

messenger RNA, GAM4446 target RNA, herein designated GAM TARGET RNA. GAM4446 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4446 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4446 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4446 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4446 RNA, herein designated GAM RNA, to target binding sites on GAM4446 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4446 target RNA into GAM4446 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4446 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4446 target genes. The mRNA of each one of this plurality of GAM4446 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4446 RNA, herein designated GAM RNA, and which when bound by GAM4446 RNA causes inhibition of translation of the GAM4446 target mRNA into a corresponding GAM4446 target protein.

The mechanism of the translational inhibition exerted by GAM4446 RNA, herein designated GAM RNA, on one or more GAM4446 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4446 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4446 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4446 RNA, herein designated GAM RNA, of GAM4446 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4446 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target

binding sites to GAM4446 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4446 RNA correlate with, and may be deduced from, the identity of the GAM4446 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4448 6008 CACTTTCATG Fig. 8 further provides a conceptual description of another novel bioinformatically
TCTGCCTTCT detected oligonucleotides of the present invention, referred to here as Genomic Address
TTGCTGGAAG Messenger 4448 (GAM4448) oligonucleotides modulates expression of respective target genes
GTGCCTCCCT whose function and utility is known in the art.

ATTCCACAGA GAM4448 is a novel bioinformatically detectable regulatory, non protein coding,
CTTTGGATCA micro RNA (miRNA)-like oligonucleotide. The method by which GAM4448 was detected is

GTGGGTGTGG described with additional reference to Figs. 9-15.

GGGAATCCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GGCAGACCAT encoded by the human genome.

GAAATG GAM4448 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4448
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4448
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4448 precursor RNA is designated SEQ ID:6008, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6008 is located from position 33327986 to position 33328081 relative to chromosome 10 on the `+` strand.

GAM4448 precursor RNA folds onto itself, forming GAM4448 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4448 precursor RNA, designated SEQ ID NO: 6008, and a schematic representation of a predicted secondary folding of GAM4448 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4448 folded precursor RNA yielding a GAM4448 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an

enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4448 RNA, hereby incorporated herein.

GAM4448 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4448 target RNA, herein designated GAM TARGET RNA. GAM4448 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4448 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4448 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4448 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4448 RNA, herein designated GAM RNA, to target binding sites on GAM4448 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4448 target RNA into GAM4448 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4448 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4448 target genes. The mRNA of each one of this plurality of GAM4448 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4448 RNA, herein designated GAM RNA, and which when bound by GAM4448 RNA causes inhibition of translation of the GAM4448 target mRNA into a corresponding GAM4448 target protein.

The mechanism of the translational inhibition exerted by GAM4448 RNA, herein designated GAM RNA, on one or more GAM4448 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4448 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4448 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4448 RNA, herein designated GAM RNA, of GAM4448 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4448 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4448 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4448 RNA correlate with, and may be deduced from, the identity of the GAM4448 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4459 6295 GAAGAGGCCT Fig. 8 further provides a conceptual description of another novel bioinformatically

TTTCTTCCAT Messenger 4459 (GAM4459) oligonucleotides modulates expression of respective target genes
TCTCACCCCT whose function and utility is known in the art.

CTGTTTCTGC GAM4459 is a novel bioinformatically detectable regulatory, non protein coding,
CAGAATTGTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM4459 was detected is

ACAGCAGGGC described with additional reference to Figs. 9-15.

AGAAAATGGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CTTTTCGTGC encoded by the human genome.

AGAGTTGACA GAM4459 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4459
AGATACAGGG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4459
TAGTGAAGAC precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar
AAGAATCTTC to the nucleotide sequence of GAM4459 precursor RNA is designated SEQ ID:6295, and is

provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6295 is located from position 18267651 to position 18267780 relative to chromosome 7 on the `+` strand.

GAM4459 precursor RNA folds onto itself, forming GAM4459 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4459 precursor RNA, designated SEQ ID NO: 6295, and a schematic representation of a predicted secondary folding of GAM4459 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated

herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4459 folded precursor RNA yielding a GAM4459 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4459 RNA, hereby incorporated herein.

GAM4459 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4459 target RNA, herein designated GAM TARGET RNA. GAM4459 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4459 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4459 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4459 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4459 RNA, herein designated GAM RNA, to target binding sites on GAM4459 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4459 target RNA into GAM4459 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4459 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4459 target genes. The mRNA of each one of this plurality of GAM4459 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4459 RNA, herein designated GAM RNA, and which when bound by GAM4459 RNA causes inhibition of translation of the GAM4459 target mRNA into a corresponding GAM4459 target protein.

The mechanism of the translational inhibition exerted by GAM4459 RNA, herein designated GAM RNA, on one or more GAM4459 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4459 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4459 folded precursor RNA, herein

designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4459 RNA, herein designated GAM RNA, of GAM4459 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4459 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4459 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4459 RNA correlate with, and may be deduced from, the identity of the GAM4459 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4516 6706 GGAGACGAAC Fig. 8 further provides a conceptual description of another novel bioinformatically

ACATACACAG detected oligonucleotides of the present invention, referred to here as Genomic Address

AAGATTCAGA Messenger 4516 (GAM4516) oligonucleotides modulates expression of respective target genes

CACACTTGCA whose function and utility is known in the art.

ATGTATTGCT GAM4516 is a novel bioinformatically detectable regulatory, non protein coding,

GGGGATTCTC micro RNA (miRNA)-like oligonucleotide. The method by which GAM4516 was detected is

CAGCATTGGC described with additional reference to Figs. 9-15.

ATGATGGAGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGGTGGAGAA encoded by the human genome.

TCATTTGACC GAM4516 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4516

GCCTCC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4516

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4516 precursor RNA is designated SEQ ID:6706, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6706 is located from position 50034558 to position 50034663 relative to chromosome 12 on the `+` strand.

GAM4516 precursor RNA folds onto itself, forming GAM4516 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of

the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4516 precursor RNA, designated SEQ ID NO: 6706, and a schematic representation of a predicted secondary folding of GAM4516 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4516 folded precursor RNA yielding a GAM4516 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4516 RNA, hereby incorporated herein.

GAM4516 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4516 target RNA, herein designated GAM TARGET RNA. GAM4516 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4516 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4516 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4516 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4516 RNA, herein designated GAM RNA, to target binding sites on GAM4516 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4516 target RNA into GAM4516 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4516 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4516 target genes. The mRNA of each one of this plurality of GAM4516 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4516 RNA, herein designated GAM RNA, and which when bound by GAM4516 RNA causes inhibition of translation of the GAM4516 target mRNA into a corresponding GAM4516 target protein.

The mechanism of the translational inhibition exerted by GAM4516 RNA, herein designated GAM RNA, on one or more GAM4516 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational

inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4516 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4516 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4516 RNA, herein designated GAM RNA, of GAM4516 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4516 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4516 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4516 RNA correlate with, and may be deduced from, the identity of the GAM4516 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4538 7030 TCCCTCCTGT Fig. 8 further provides a conceptual description of another novel bioinformatically

GTCCCAAAAC detected oligonucleotides of the present invention, referred to here as Genomic Address

GAAAACACTC Messenger 4538 (GAM4538) oligonucleotides modulates expression of respective target genes

CTATATTTTG whose function and utility is known in the art.

TAGCGCCTTC GAM4538 is a novel bioinformatically detectable regulatory, non protein coding,

CAGAATGGGG micro RNA (miRNA)-like oligonucleotide. The method by which GAM4538 was detected is

CAGCGGAAAC described with additional reference to Figs. 9-15.

TAGTGTTGGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACAAAGGAGG encoded by the human genome.

CGA GAM4538 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4538

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4538

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4538 precursor RNA is designated SEQ ID:7030, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7030 is located from position 53161338 to position 53161430 relative to chromosome 15 on the `-` strand.

GAM4538 precursor RNA folds onto itself, forming GAM4538 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4538 precursor RNA, designated SEQ ID NO: 7030, and a schematic representation of a predicted secondary folding of GAM4538 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4538 folded precursor RNA yielding a GAM4538 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4538 RNA, hereby incorporated herein.

GAM4538 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4538 target RNA, herein designated GAM TARGET RNA. GAM4538 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4538 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4538 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4538 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4538 RNA, herein designated GAM RNA, to target binding sites on GAM4538 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4538 target RNA into GAM4538 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4538 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4538 target genes. The mRNA of each one of this plurality of GAM4538 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4538 RNA, herein designated GAM RNA, and which when bound by GAM4538 RNA causes inhibition of translation

of the GAM4538 target mRNA into a corresponding GAM4538 target protein.

The mechanism of the translational inhibition exerted by GAM4538 RNA, herein designated GAM RNA, on one or more GAM4538 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4538 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4538 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4538 RNA, herein designated GAM RNA, of GAM4538 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4538 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4538 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4538 RNA correlate with, and may be deduced from, the identity of the GAM4538 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4544 6981 TATGAACTGG Fig. 8 further provides a conceptual description of another novel bioinformatically

CCACTTTTCA detected oligonucleotides of the present invention, referred to here as Genomic Address

GATGAAACCT Messenger 4544 (GAM4544) oligonucleotides modulates expression of respective target genes

GGTGGGCCAG whose function and utility is known in the art.

CTCTGTGGGG GAM4544 is a novel bioinformatically detectable regulatory, non protein coding,

TGATGCATTT micro RNA (miRNA)-like oligonucleotide. The method by which GAM4544 was detected is

AAAAGGGCAG described with additional reference to Figs. 9-15.

TTCATG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM4544 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4544

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4544

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of GAM4544 precursor RNA is designated SEQ ID:6981, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6981 is located from position 100974291 to position 100974366 relative to chromosome 9 on the `+` strand.

GAM4544 precursor RNA folds onto itself, forming GAM4544 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4544 precursor RNA, designated SEQ ID NO: 6981, and a schematic representation of a predicted secondary folding of GAM4544 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4544 folded precursor RNA yielding a GAM4544 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4544 RNA, hereby incorporated herein.

GAM4544 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4544 target RNA, herein designated GAM TARGET RNA. GAM4544 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4544 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4544 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4544 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4544 RNA, herein designated GAM RNA, to target binding sites on GAM4544 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4544 target RNA into GAM4544 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4544 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4544 target genes. The mRNA of each one of this plurality of GAM4544 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4544 RNA, herein designated GAM RNA, and which when bound by GAM4544 RNA causes inhibition of translation of the GAM4544 target mRNA into a corresponding GAM4544 target protein.

The mechanism of the translational inhibition exerted by GAM4544 RNA, herein designated GAM RNA, on one or more GAM4544 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4544 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4544 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4544 RNA, herein designated GAM RNA, of GAM4544 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4544 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4544 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.
